10. BRIEF SUMMARY OF SIGHTING See Case Folder Case associated with case from Sandy Hook, N.J.			11. COMMENTS Extensive investigation revealed that the target on 10 Sept was caused by a Balloon. Targets on 11 September were attributed to Anomalous Propagation by Radar analysts.		

UNCLASSIFIED

This is a special report on the investigation of the sighting of an unidentified aerial object. Special reports such as this will be made on outstanding incidents and in incidents where such a report is requested by higher authority.

UNCLASSIFIED

Forty-five seconds after the initial sighting, the passenger noted the object to be turning left near Freehold, New Jersey. This can be explained by the fact that the T-33 was turning and the relative motion caused the balloon to appear to be turning. As the T-33 continued inland, the line of sight changed until the balloon was silhouetted against the sea or sky and being silver blended into the background and was lost. This "disappearance" of balloons is a common occurrence with pilots tracking research balloons.

It is apparent from the above that several assumptions had to be made in order to show that the object was one of the balloons released at Evans Signal Laboratory, but the fact there was a balloon in the near vicinity and the fact that the pilot and observer were not sure of their exact track adds a great deal of credence to the assumptions. However, since assumptions were made, it cannot be concluded that the object was definitely a balloon.

II. RADAR SIGHTINGS FROM FORT MONMOUTH, NEW JERSEY

A. Discussion

All of the radar sightings during this period were made by students at the Fort Monmouth training center. In addition to this, the students involved were taking a maintenance course. The instructor would put certain mechanical or electronic difficulty in the set and let the student find and remedy trouble. If the student became proficient in this phase, he was allowed to operate the set much the same as in tactical operations. No plotting records, logs or data of any type were kept. It should be stressed that these students were maintenance students, not operators.

1. On 10 September 1951 an ~~AN/AP-33~~ radar set picked up a fast-moving, low-flying target (exact altitude undetermined) at approximately 1110 hours southeast of Fort Monmouth at a range of about 12,000 yards. The target appeared to approximately follow the coast line changing its range only slightly but changing its azimuth rapidly. The radar set was switched to full-aided azimuth tracking which normally is fast enough to track jet aircraft, but in this case was too slow to be resorted to. The target was lost in the northeast at a range of about 14,000 yards.

Upon interrogation, it was found that the operator, who had more experience than the average student, was giving a demonstration for a group of visiting officers. He assumed that he was picking up a high-speed aircraft because of his inability to use ~~full-aided azimuth tracking~~ which will normally track an aircraft at speeds up to 700 mph. Since he could not track the target he assumed its speed to be about 700 mph. However, he also made the statement that he tracked the object off and on from 1117 to 1119, or three minutes. Using this time and the ground track, the speed is only about 400 mph.

No definite conclusions can be given due to the lack of accurate data but it is highly probable that due to the fact that the operator was giving a demonstration to a group of officers, and that he thought he picked up a very unusual radar return, he was in an excited state, accounting for his inability to use ~~full-aided azimuth tracking~~. He admitted he was "highly frustrated" in not being able to keep up with the target using the aided tracking. The weather on 10 September was not favorable for anomalous propagation.

[REDACTED]

UNCLASSIFIED

2. On 10 September 1951, 1515 hours, an ~~SCR-584~~, serial number ~~453~~, tracked a target which moved about slowly in azimuth north of Fort Monmouth at a range of about 30,000 yards at the extremely unusual elevation angle of 1350 mils, (altitude approximately 93,000 ft.). This was proven to be a weather balloon. It was tracked at the request of the Commanding Officer of the Student Attachment to determine the altitude in order to establish who won a pool concerning what the altitude of a balloon which was sighted might be.

3. On 11 September 1951, 1050 hours, two ~~SCR-584s~~, serial numbers ~~217~~ and ~~216~~, picked up the same target northeast of Fort Monmouth at an elevation angle of 250 to 300 mils at a range of approximately 30,000 yards (approximate altitude 31,000 feet). The sets track automatically in azimuth and elevation and with aided range tracking are capable of tracking targets up to a speed of 700 mph. In this case, however, both sets found it impossible to track the target in range due to its speed and the operators had to resort to manual range tracking in order to hold the target. The target was tracked in this manner to the maximum tracking range of 30,000 yards. The operators judged the target to be moving at a speed several hundred miles per hour higher than the maximum aided tracking ability of the radar sets. This target provided an extremely strong return echo at times even though it was at maximum range, however, the echo signal occasionally fell off to a level below normal return. These changes coincided with maneuvers of the target.

This sighting proved to be a weather balloon. How it was determined is unknown but ATIC was informed that it was a balloon by AFMIL-TC telecon TT-252, dated 5 October 1951, USAF Item 11, which stated: "Radar sighting was later identified as weather balloon. Target track was vertical. Later exploded and descended to ground."

4. On 11 September 1951, at about 1330, a target was picked up on an ~~SCR-584~~ radar set, serial number 215, that displayed unusual maneuverability. The target was approximately over Lavenook, New Jersey, as indicated by its 10,000 yard range, 6,000 feet altitude and due north azimuth. The target remained practically stationary on the scope and appeared to be hovering. The operators looked out of the van in an attempt to see the target since it was at such a short range, however, overcast conditions prevented such observation. Returning to their operating positions the target was observed to be changing its elevation at an extremely rapid rate, the change in range was so small the operators believed the target must have risen nearly vertically. The target ceased its rise in elevation at an elevation angle of approximately 1,500 mils at which time it proceeded to move at an extremely rapid rate in range in a southerly direction once again the speed of the target exceeding the aided tracking ability of the ~~SCR-584~~ so that manual tracking became necessary. The radar tracked the target to the maximum range of 30,000 yards at which time the target was at an elevation angle of 300 mils. The operators did not attempt to judge the speed in excess of the aided tracking rate of 700 mph.

It is highly probable that this is an example of anomalous propagation as the weather on 11 September was favorable for this type of phenomenon. The students stated that they were aware of this phenomenon, however, it is highly probable that due to the previous sightings of what they thought were unusual types of aircraft, they were in the correct psychological condition to see more such objects.

UNCLASSIFIED

CONFIDENTIAL

III. CONCLUSIONS

A. The unidentified aircraft reported by the T-33 pilots was probably a balloon launched by the Evans Signal Laboratory a few minutes before the T-33 arrived in the area.

B. The 1110 EBST radar sighting on 10 September 1951 was not necessarily a very high-speed aircraft. Its speed was judged only by the operator's inability to use aided tracking and this was possibly due to the operator being excited, and not the high speed of the aircraft.

C. The 1515 EBST radar sighting on 10 September 1951 was a weather balloon.

D. The 1050 EBST radar sighting on 11 September 1951 was a weather balloon.

E. The 1330 EBST radar sighting on 11 September 1951 remains unknown but it was very possible that it was due to anomalous propagation and/or the student radar operators' thoughts that there was a great deal of activity of unusual objects in the area.

FORT MONMOUTH, NEW JERSEY - 10-11 September 1951

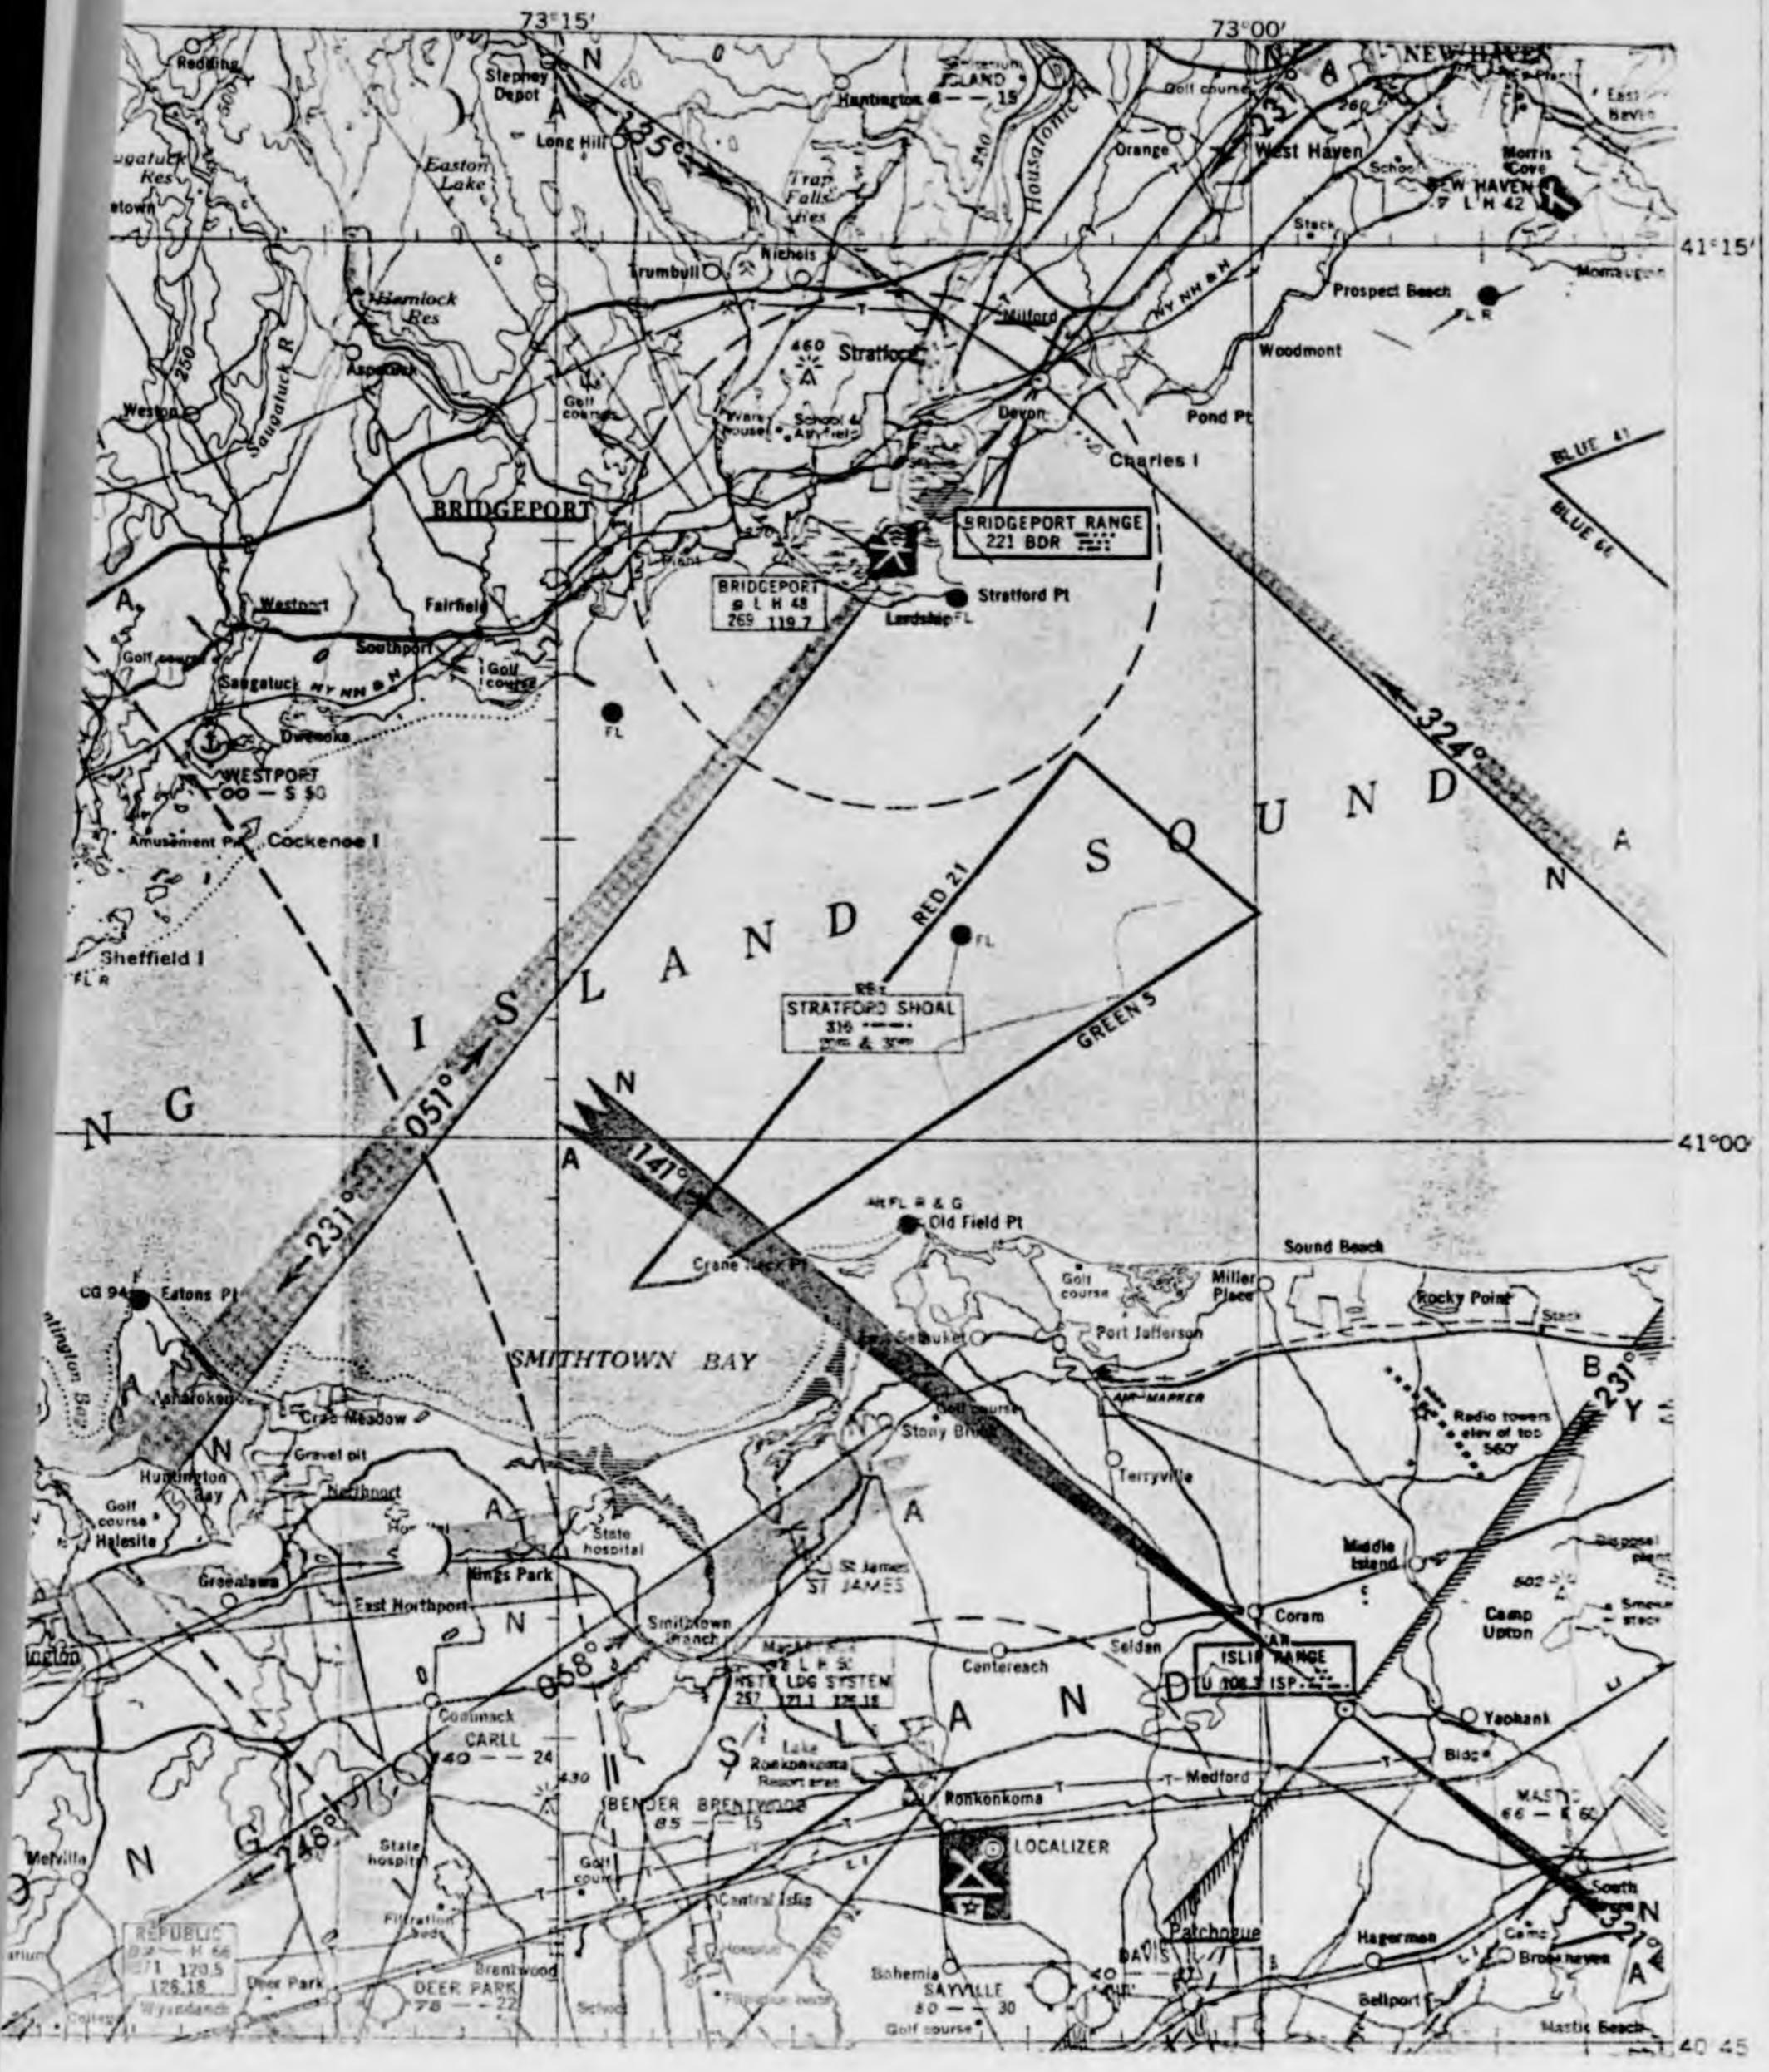

On 10 and 11 September 1951, a series of incidents occurred in the area of Fort Monmouth, N. J. An initial sighting of an unidentified object was made on a radar set. Soon after the radar sighting, two Air Force officers in a T-33 aircraft unsuccessfully attempted to intercept an unidentified object. Later several more radar sightings were reported.

Status of Investigation

A complete investigation of this incident was carried out and will be reported in Project Grudge Special Report No. 1. It has been tentatively determined that the T-33 pilots probably observed a balloon that had been launched a few minutes prior to their arrival in the area. Two of the radar sightings were returns from balloons and the others were probably due to weather phenomena and excitement of the student operators due to previous sightings. Only one radar return cannot be explained. The operator who observed this incident assumed the object was traveling over 700 mph because the radar set's automatic tracking would not follow the target. It is possible that the inability to track the object was due to his inability to properly operate the set under mental stress.

HEADQUARTERS
SIGNAL CORPS CENTER AND FORT MONMOUTH
Fort Monmouth, New Jersey

12 September 1951

1. On 10 September 1951 an AN/MPG-1 radar set picked up a fast moving low flying target (exact altitude undetermined) at approximately 1110 hours southeast of Fort Monmouth at a range of about 12,000 yards. The target appeared to approximately follow the coast line changing its range only slightly but changing its azimuth rapidly. The radar set was switched to full aided azimuth tracking which normally is fast enough to track jet aircraft, but in this case was too slow to be resorted to. The target was lost in the northeast at a range of about 14,000 yards. This target also presented an unusually strong return for an aircraft being comparable in strength to that usually received from a coastal ship. The operator initially identified the target as a ship and then realized that it could not be a ship after he observed its extreme speed.

2. On 10 September 1951, 1515 hours, an SCR 584, serial number 433 tracked a target which moved about slowly in azimuth north of Fort Monmouth at a range of about 32,000 yards at the extremely unusual elevation angle of 1350 mils. (altitude approx. 93,000 ft)

3. On 11 September 1951, 1050 hours, two SCR 584's serial numbers 217 and 315 picked up the same target northeast of Fort Monmouth at an elevation angle of 350 to 300 mils at a range of approximately 30,000 yards. (approximate altitude 31,000 ft) The sets track automatically in azimuth and elevation and with aided range tracking are capable of tracking targets up to a speed of 700 mph. In this case however, both sets found it impossible to track the target in range due to its speed and the operators had to resort to manual range tracking in order to hold the target. The target was tracked in this manner to the maximum tracking range of 32,000 yards. The operators judged the target to be moving at a speed several hundred miles per hour higher than the maximum aided tracking ability of the radar sets. This target provided an extremely strong return echo at times even though it was at maximum range, however the echo signal occasionally fell off to a level below normal return. These changes coincided with maneuvers of the target.

4. On 11 September 1951 at about 1330 a target was picked up on an SCR-584 radar set serial number 315 that displayed unusual maneuverability. The target was approximately over Navesink, New Jersey as indicated by its 10,000 yard range, 6000 ft altitude and due north azimuth. The target remained practically stationary on the scope and appeared to be hovering. The operators looked out of the van in an attempt to see the target since

FORT MONMOUTH, NEW JERSEY, INCIDENTS

On 10 and 11 September 1951, a series of both visual and radar sightings were reported from the Fort Monmouth, New Jersey, area.

I. VISUAL SIGHTING BY PILOT AND PASSENGER OF T-33 AIRCRAFT

A. Discussion

At approximately 1135 EAST an unidentified object was sighted by the pilot of a T-33 aircraft, an Air Force Lieutenant, enroute to Mitchell Air Force Base, New York, from Dover Air Force Base, Delaware. The object appeared to be over Sandy Hook, New Jersey, between 5000 ft. and 6000 ft. at 11 o'clock from the aircraft heading. The T-33 was approximately over Point Pleasant, New Jersey, at the time of the initial sighting. Upon sighting the object, the pilot started descending at 300° turn to the left in an attempt to intercept and identify the object. Approximately 45 seconds after the pilot first sighted the object, the passenger, an Air Force Major, who had been taking a radio check, sighted the object. The object was then over Freshkill, New Jersey, making a 120° turn toward the coast. The pilot continued his 300° turn but the object was lost as it crossed the coast. During the descending turn the speed of the T-33 increased from 450 to 550 mph and the altitude decreased from 18,000 ft. to 17,000 ft. (See enclosed overlay.)

When first sighted, the object appeared to be descending over Sandy Hook, New Jersey. It then leveled out and maintained a constant altitude. The object was round and silver in color but did not reflect the sunlight. At one time during the attempted intercept, it appeared flat. The size was judged to be 3 ft. to 5 ft. in diameter.

At approximately 1112 EAST, 10 September 1951, two balloons were released from the Evans Signal Laboratory, New Jersey, located at 40° 13' N and 74° 04' E. (See enclosed overlay.) These balloons are 7 ft. - 8 ft. in diameter at time of release and expand on ascending. They ascend at an average of 300 fpm and are painted silver for radar tracking. Experienced balloon observers state that when viewed from certain angles they appear to be disc-shaped. At 1135 EAST these balloons would have been at approximately 18,000 ft., and would have moved to a position nearly in line with Point Pleasant, New Jersey, and Sandy Hook. (Ind SS at 10-15 knots.)

Attempts were made to use the information obtained from the interrogation of the T-33 crew and the data on the balloon launching to prove that the pilot and passenger of the T-33 had observed a balloon. However, not all of the data given was consistent with such a conclusion.

In an attempt to establish the fact that the object was a balloon, a flight path similar to the one given by the T-33 crew was assumed. (See "Assumed Path of T-33" in inclosure.) The T-33 crew was interrogated twice and gave different flight paths and tracks of the object at each one. It is therefore assumed that due to the altitude and speed of the T-33, and the fact

AIR INTELLIGENCE INFORMATION REPORT

REPORT NO.	IR-3-50B	PAGE	2	OF	2	PAGES
------------	----------	------	---	----	---	-------

On 10 September, Major [redacted] and Lt. [redacted] of the 148th Fighter Interceptor Squadron, spotted an unidentified object over Sandy Hook, New Jersey. Their T-33 was at 20,000 feet, the object was well below, heading southwest. Lt. [redacted] was first to sight the object (1135 EDT) since Major [redacted] was making a position report.

Lt. [redacted] followed the object in a diving turn to the left descending to an altitude of about 16,000 feet with the object about 8,000 feet below and to the right of the aircraft. Thereafter he tried to keep a course paralleling, but above, that of the object.

As soon as Major [redacted] completed his radio check-in he was notified of the strange object. Both watched it make a 90 degree turn to the left and kept it under observation together while it covered approximately 20 miles before it disappeared out to sea. (Refer to statements of pilots and map.)

Lt. [redacted] in control of the T-33, had the object in sight for about two minutes with the object covering a distance of about 35 miles; Major [redacted] had the object in sight for less than a minute. As to the weather and description of the object see attached statements.

On the same date a radar station at Ft. Monmouth reported two targets that were unidentified, traveling over 700 mph, and giving returns that could not be explained as being equipment malfunction, anomalous propagation, or anything but an actual target as described in the attached report. However, the possibility exists that the news item reporting the observation by the fighter pilots could have caused the imaginations of the radar observers to run wild. This is considered remote in view of the number of observers witnessing the scope returns and the fact that four such incidents are reported in two days. However, the possibility is being investigated and results will be submitted upon receipt.

SUMMARY: (Enter concise summary of report. Give significance in final one-sentence paragraph. List inclusions at lower left. Begin text of report on AF Form 112 Part II.)

On 10 September, Major [redacted] and Lt. [redacted] were participating in a training flight from Dover AFB, Delaware to Mitchel AFB, New York (Direct), when they spotted an unidentified object over Sandy Hook, New Jersey.

The time was 1135 EDT, and the weather was CAVU. When spotted, the object was at an estimated altitude of 8,000 feet. Flying at 20,000 feet, the pilot immediately made a diving turn in his F-33 and followed and timed the object until it disappeared two minutes later.

Both pilots observed the strange object, which appeared to be the size of an F-86 but much faster (900+ mph), disc-shaped, steady in flight with no visible means of propulsion, and shiny silver in color.

At 1110 EDT a radar station at Ft. Monmouth plotted an unidentified, high speed (above 700 mph) object in approximately the same location.

This headquarters has no information regarding natural phenomena, experimental aircraft or guided missiles that could have caused the observations.

Request USAF evaluation of incident be furnished this headquarters.

SUMMARY: (Enter concise summary of report. Give significance in final one sentence paragraph. List inclusions at end of text. Begin text of report on AF Form 112-Part II.)

Further investigation of sighting report from Ft. Monmouth reveals that although the observing personnel state that they had no information of an unidentified flying object being sighted by two fighter pilots of this command on 10 September 1951, they were alerted to the possibility of unusual sightings occurring on their radar scopes.

The fact remains that one experienced observer was present and saw an object travelling more than 700 mph on 11 September in the New York area.

that crew intent on watching the object, they could not pin point their ground track any closer than 5 nautical miles and thus it would be feasible to assume a flight path within 5 nautical miles of the given track. Since the two interrogations as to location of the ground tracks differed to some extent, the track marked on a chart included with signed statement is assumed to be most nearly correct.

Referring to the assumed flight path on the enclosed overlay, at A, the object appeared to be over Sandy Hook. It will be noted that a comparatively small object closer to the a/c would appear to be large if assumed to be over Sandy Hook. (See Figure 1.)

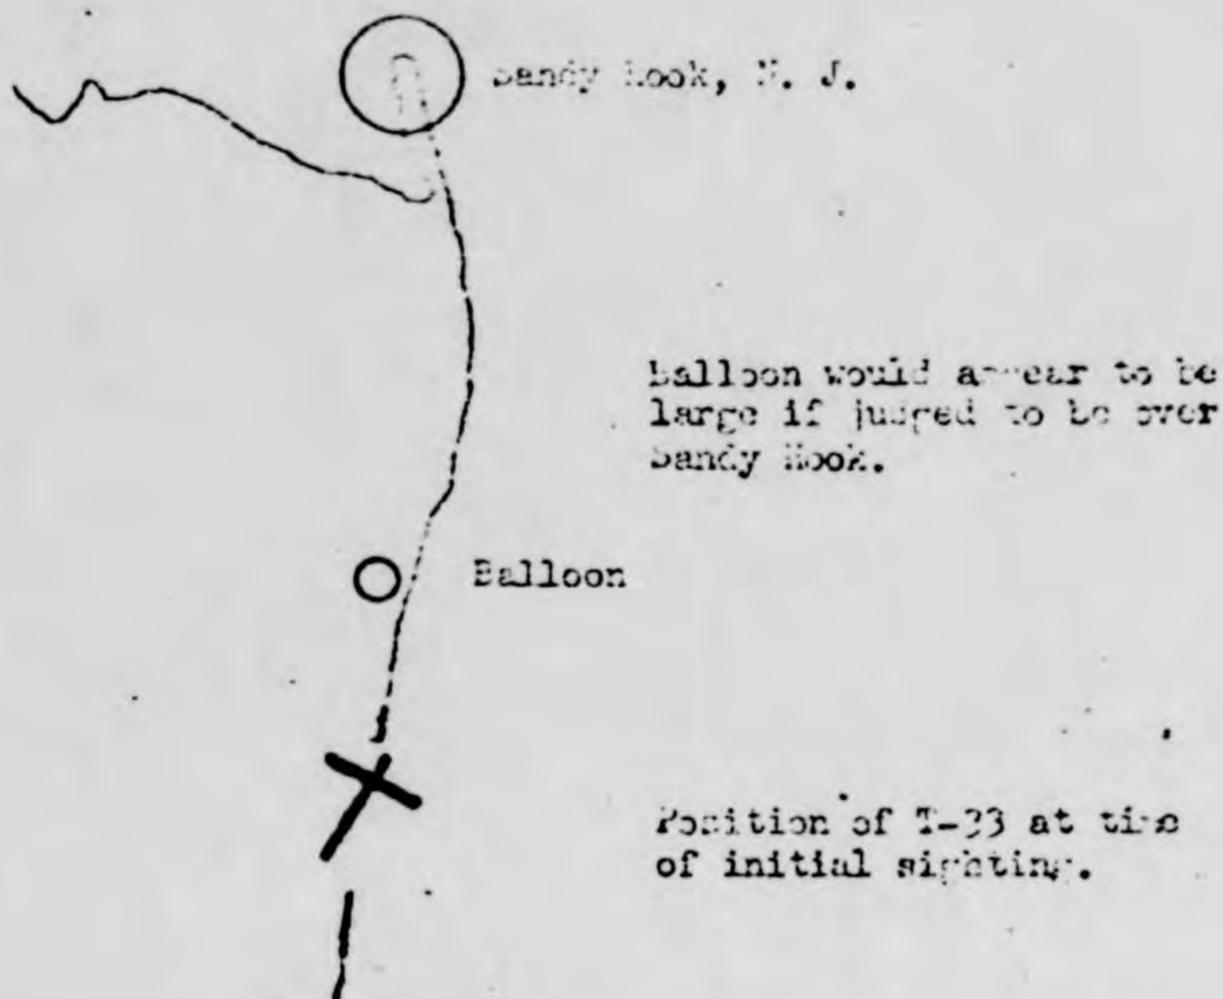

Figure 1. Plan View of Initial Sighting
(not to scale)

As the T-33 approached the balloon, the balloon appeared to be traveling at a high rate of speed. Several seconds must have passed after the initial sighting while the pilot decided that the object was not a conventional a/c and that he should attempt to identify it. During this period, it is assumed that the a/c continued on course making the object appear to be flying straight and level on a reciprocal heading. The fact that the object appeared to be descending when first sighted cannot be explained. The fact that only one of the two balloons was seen can be explained by the fact that the observers concentrated on one balloon and did not notice the other one.

FROM: HQ LIAISON	REPORT NO. IR-4-110	PAGE 2 OF 2 PAGES
------------------	------------------------	-------------------

1. All personnel listed in initial report from Ft. Monmouth were students, with the exception of Mr. [REDACTED]. Mr. [REDACTED] has been a qualified radar observer since 1942 and states he had no knowledge of a "flying saucer" report prior to observation. Further states observed target was not similar to any observation ever made by him.

2. Item listed in paragraph 2, initial Ft. Monmouth report, was later identified as a balloon.

3. Radar sets at Ft. Monmouth were in first class mechanical condition. However, tests will be conducted during hours that sightings were made on 10 and 11 September in order to check possibility of recurrence of targets and/or explanation for same.

4. At variance with paragraph 1, above, is fact that the Ft. Monmouth FIO called the radar section on the morning of 10 September asking "if they had seen anything unusual". A negative reply was received by the FIO, but word spread throughout the student body that something unusual was going on.

A. Reference to weather effecting radar

US.

The following information was obtained from the weather bureau, ^{Washington} ~~Washington, D.C.~~ ^{DC}
on the Lakehurst NJ at
weather ~~report~~ at Lakehurst 10)30, 10 Sept 1951, ~~Washington, D.C.~~

Southerly winds, a high pushing out off the coast extending for at least 100 miles north and south of Fort Monmouth area. No precipitation for 600 miles in any direction from Fort Monmouth. A few scattered high x cirrus clouds at approximately 25,000 ft. No significant inversion below 16,000 ft. An inversion at 16-17,000 ft of 1°C/thousand increase. Air was quite moist up to 14,000 ft - no water droplets. No inversion above 17,000 ft up to tropopause (47,000) Temperature 47,000 was - 67°C a total inversion of 2°C up to 60,000 ft. Temperature decreased from -65^{°C} to 75,000^{ft} rapidly to -48°C. Didn't get good sounding 2200 EST, however, no significant change occurred - ~~believed difficult~~ ^{but that would have} Nothing ~~believed to~~ give erroneous radar signals.

Weather report at Stewart Air Force Base 10:00, 11 September 1951.
(No soundings made in the near vicinity of Lakehurst on 10 Sept 1951) N.Y.
Indications of an upper front dissipating in the area West of Newburgh. This front carried weak showers which would appear all along the coast (along a line extending from Sandy Hook to La Guardia). There was a very pronounced inversion at 1000 ^{hse} between 2000 and 2500 ft of about 3°C/1000 ft increase in temperature. Within 75 miles of Fort Monmouth at 1000 there were brief showers (small amount of precipitation traces in the order of 100th inch. Water droplets 3-5000 ft. Strata ^{from} ~~from~~ decks at 10-14000 ft. Sounding was ended at 42,000 ft. In general cumulus clouds with considerable density were encountered. Clouds with water droplets at 10,000 ft at 1000 ^{hse} lowering ~~to~~ 2000 ft at 1600 ^{hse}.

Dr. Herbert S. Bennet, EWC, Fort Monmouth, N.J.

Statement of Dr. Bennet

EWC is interested in countering airborne devices. They are limited in scope of operation to anything that can be countered from a ground installation. Their operations pertain to Army operation.

Major Martin, observer at Twin Lights, heard pilots comments on radio at his station. When Bennet heard via commercial radio that pilots observed an object, he contacted Martin to see if an echo was received on radar scope.

Dr. Bennet stated that EWC (Electronics Warfare Corps) was not operating or performing tests that would cause phenomenon as picked up by radar scopes. Dr. Bennet also stated that he was not aware of other projects that could cause these radar sightings.

When questioned as to date, Dr. Bennet stated that the incident happened the day before he visited Major Martin. The radio report was on the same day that he made his visit to Major Martin who was in charge of a CPS-6B radar installation. When queried as to possible causes of such sightings he suggested several possibilities.

1. Constant altitude balloon. In order to maintain constant altitude during night and day operation (diurnal variants) it is necessary that the balloon drop ballast at night. If for some reason or other, a faulty release prevented dropping of ballast during night, the balloon would float to a low altitude. This would cause the balloon to deflate on the top which would make it look like a saucer shape when looking down on upper surface. The possibility of the pilots looking down on the object just as the faulty mechanism released the ballast would indicate an increase in vertical velocity. This balloon could be either a General Mills or NYU project. It was Dr. Bennet's belief

that if the balloon was 1000-2000 ft altitude that a PPI scope would not indicate ^{the balloon having} more than the velocity caused by the horizontal components of wind.

Therefore, it is not expected that any faulty ballast release would result in high horizontal velocities. His final analysis was that if high horizontal velocity were indicated on the scope that this would not be the result of a balloon.

Dr. Bennet was queried on signal strength ~~for~~ ^{whether} of a balloon and would it give signal strength of a B-29 or B-36 at 20,000 yds. He stated that if the balloon was painted silver as many of them are and it was at an altitude of 5000' or ~~kg~~ higher, that signal response would be equal to that of a B-29 or B-36 at 20,000 ft. His comment was that in general these balloons were used for soundings of between 30,000 and 110,000 ft (extent of Bennet's knowledge). He also stated that sun ^{the} could make a balloon look as if it were oscillating.

2. Combined meteorological and oblique incident wave front.

A wave front such as this could give a signal response giving great apparent speed on a radar scope, even though the actual speed of this wave is low.

Private

SSN 3952, Fort Monmouth

Duty requires that as a student must learn how to repair, adjust, and operate radar equipment. Started radar course 7 May 1951. Previous experience is that of a radio repair man. Service dates back to Dec 1950. Graduated from radio and television school (Coyne, in Chicago)

Story as given by Private

One Tuesday (not certain of day of date) morning SCR-584A station #315 having a maximum range of 70,000 yds and capable of aided tracking up to 30,000 yds picked up an object, altitude 0-(10-20) miles, azimuth range of aircraft was 20,000 yds and elevation of 800 miles. azimuth 10-15 degrees. Had trouble keeping object on elevation. Object faded intermittingly. The time was approximately 10-10:30. Time on scope was 5 minutes maximum. Believed this was a good radar day. Blip looked good - good return. PPI gave good bright spot of approximately 1/8 inch and was well defined. Subject knows about anomalous propagation. Subject stated that Pvt. saw same object that day.

Remarks:

This set will track up to a speed of approximately 700 mph. A plotting board is not normally used in this particular training course. Antenna is usually checked by sighting on Shrewsbury water tower. Prior to sighting instructor mal-adjusted the radar set, thus setting up a problem for the students. It was necessary for to adjust the klystron, receiver, magnetrons. working schedule was 7:30 to 5:30 and leaves area for chow by 11:20. Believes he went off this set on the 14th Sept. Operator believes set was in good working order since commercial aircraft were sighted and tracked prior to sighting of object.

Private Juan [redacted], SSN 3952, Fort Monmouth

Private [redacted] was a member of a radar training detachment at Fort Monmouth, N.J. He started this course 7 May 1951 and has been in the service since Dec 1950. His course on the SCR-584 was completed approximately 14 September 1951. His work to date in radar encompassed operational and maintenance procedures on SCR-584, NPG-1 and TPL. Has had previous radio and television training in N.Y.

Y. J. [redacted] as given by Private [redacted]
Pvt. [redacted] statement.

Has operated and performed all maintenance functions on set No. 315, SCR-584. He is a member in the same crew as Pvt. [redacted]. Believes he is capable and knows what a return of an aircraft looks like. The opinion of the interrogator is that he is not too familiar with aircraft designations since he stated that a DC-4 has two engines, however he gives indications that he can distinguish between reciprocating and jet aircraft. He was outside ~~of~~ the van working on the console of another unit when [redacted] picked up object. He did not observe [redacted] sightings. He was told by another member of the crew that Allen's observed on his radar set a fast moving object. He observed at 1500 two jets, on his radar scope, azimuth was north of radar set location (azimuth 280°) Elevation was low, just above tree level. Went out of van and visually sighted two jets, silver in color, headed east. Opinion of [redacted] was that [redacted] saw a jet. He stated that the radar set was in good working order. He stated that he saw a similar object to that seen by [redacted] at 800 miles elevation and 23000 yds range, azimuth ESE. Could not recall time or date.

Private Fort Monmouth

Private was a member of a radar training detachment and stationed at Fort Monmouth. His background is that of a student majoring in mathematics at MIT and was to have graduated in the class of 1951.

Story as given by Private

Private stated that Mr. , an instructor, came out to the set he was working on and instructed him to look out for fast moving objects. He called Mr. shortly after and told him he saw a fast travelling object. This observation was taken as a joke at first by Mr. . Private could not remember the date of this observation, except that it was in the morning and it might have been observed on a Tuesday or a Wednesday, possibly 11 or 12 September.

stated that his set was working satisfactorily and that he picked up the object at 5700 miles azimuth and had a good return on the range scope. He put the set into automatic track and noted that the object travelled in an erratic manner. It was always in range and in the N-NE quadrant. The range was about 20,000 yds and never less than 15,000 yds. Always received a strong echo and wasn't bothered with fading. The object was extremely maneuverable.

estimated that the speed was 500 mph. When questioned as to what he knew of anomalous propagation, he indicated that he knew of this phenomenon but believed there was no indication ^{of this and} that weather conditions were negative this particular day for such propagation. He also stated that the signal strength was very strong and there was no variation of amplitude. He couldn't say how fast the object was climbing but estimated that the rate of climb was 9000-27,000 ft per minute. He stated that he thought the object had high acceleration

since the object changed direction or reversed its path in an extremely short time duration. One possible aid to exact date was the fact that some one came in with a newspaper account after the incident.

Information on How Fort Monmouth Students and Instructors were alerted:

PIC, Pete Hoffman, Fort Monmouth received a call from Mr. Zuckerman, Asbury Press; Hoffman believes the time was approximately 1030 and on a Tuesday. Zuckerman wanted to know if the school picked up any saucers in this area. Hoffman then called Capt Mikulas who alerted Mr. , instructor.

~~CONFIDENTIAL~~

Forty-five seconds after the initial sighting, the passenger noted the object to be turning left near Freehold, New Jersey. This can be explained by the fact that the T-33 was turning and the relative motion caused the balloon to appear to be turning. As the T-33 continued inland, the line of sight changed until the balloon was silhouetted against the sea or sky and being silver blended into the background and was lost. This "disappearance" of balloons is a common occurrence with pilots tracking research balloons.

It is apparent from the above that several assumptions had to be made in order to show that the object was one of the balloons released at Evans Signal Laboratory, but the fact there was a balloon in the near vicinity and the fact that the pilot and observer were not sure of their exact track adds a great deal of credence to the assumptions. However, since assumptions were made, it cannot be concluded that the object was definitely a balloon.

II. RAAR. SIGNALS FROM THE MONITOR, NEW JERSEY

A. Discussion

All of the radar sightings during this period were made by students at the Fort Monmouth training center. In addition to this, the students involved were taking a maintenance course. The instructor would not permit mechanical or electronic difficulty in the set and let the student find and remedy trouble. If the student became proficient in this phase, he was allowed to operate the set much the same as in tactical operations. No plotting records, logs or data of any type were kept. It should be stressed that these students were maintenance students, not operators.

1. On 10 September 1951 an AN/MP-1 radar set picked up a fast-moving, low-flying target (exact altitude undetermined) at approximately 1110 hours southeast of Fort Monmouth at a range of about 1,000 yards. The target appeared to approximately follow the coast line changing its range only slightly but changing its azimuth rapidly. The radar set was switched to full-aided azimuth tracking which normally is fast enough to track jet aircraft, but in this case was too slow to be resorted to. The target was lost in the northeast at a range of about 14,000 yards.

Upon interrogation, it was found that the operator, who had more experience than the average student, was giving a demonstration for a group of visiting officers. He assumed that he was picking up a high-speed aircraft because of his inability to use full-aided azimuth tracking which will normally track an aircraft at speeds up to 700 mph. Since he could not track the target he assumed its speed to be about 700 mph. However, he also made the statement that he tracked the object off and on from 1115 to 1118, or three minutes. Using this time and the ground track, the speed is only about 400 mph.

No definite conclusions can be given due to the lack of accurate data but it is highly probable that due to the fact that the operator was giving a demonstration to a group of officers, and that he thought he picked up a very unusual radar return, he was in an excited state, accounting for his inability to use full-aided automatic tracking. He admitted he was "highly frustrated" in not being able to keep up with the target using the aided tracking. The weather on 10 September was not favorable for anomalous propagation.

LT. CUMMINGS :-

(1) CALL FROM GENERAL MILLS, MINNEAPOLIS

"Two possibilities of balloon flights launched the 6th Sept. The first possibility: load-down 2015 EST, west of Jacksonvills, Illinois - no recovery. It is possible that balloon escaped from load and continued to float. A second load scheduled release 1000 EST, 7 Sept, 410 position, approximately 25 miles south of Pittsburgh. Likelihood remote that these balloons would continue to float 3 days."

(2) CALL FROM Mr EASTNER, RESEARCH/DEVELOPMENT CENTER, SIGNAL CORPS

"10 Sept, EDTs

- 73309 [unclear] -
[unclear]

- 0920, lasted 45 minutes
- 1339, lasted 60 minutes
- 1933, lasted 82 minutes; ascensional rate was 668 ft per min.
- 1937, lasted 73 minutes; " " " 668 " " "
- 2113, lasted 83 minutes; " " " 1000 " " "
- 2133, lasted 67 minutes; " " " 668 " " "
- 2249, duration not available.

All balloons 7 to 8 ft in diameter at the surface before release. No information on how big they got during the ascent.

10 Sept (was repeated)

Two large balloons were released at 1112 and ascended to 123,000 ft; bursting altitude 104,000 ft; diameter of balloon at the burst was 39 ft. Another large balloon was released at 1530, and ascended to 1708. The altitude was 116,000 ft, and diameter was 33 ft at burst.

11/12/57
1300
11/12/57
1300

11 Sept

The first release was at 0930 for 40 minutes; the ascensional rate was unknown. The next one was at 1439, for 38 minutes and the ascensional rate was 1772 ft per minute.

- 1922 at 73 minutes, 650 ft per minute
- 1936 at 76 " " " 691 " " "
- 2110 at 89 " " " 687 " " "
- 2141 at 79 " " " 681 " " "

All balloons had surface diameters of 7 to 8 feet. The laboratory does not have information on azimuth of balloons."

2. On 10 September 1951, 1515 hours, an SCR 584, serial number 413, tracked a target which moved about slowly in azimuth north of Fort Monmouth at a range of about 31,000 yards at the extremely unusual elevation angle of 1.50 mils, (altitude approximately 91,000 ft.). This was proven to be a weather balloon. It was tracked at the request of the Commanding Officer of the Student Attachment to determine the altitude in order to establish who won a pool concerning what the altitude of a balloon which was sighted might be.

3. On 11 September 1951, 1250 hours, two SCR 584's, serial number 217 and 315, picked up the same target northeast of Fort Monmouth at an elevation angle of 150 to 300 mils at a range of approximately 30,000 yards (approximate altitude 31,000 feet). The sets track automatically in azimuth and elevation and with aided range tracking are capable of tracking targets up to a speed of 700 mph. In this case, however, both sets found it impossible to track the target in range due to its speed and the operators had to resort to manual range tracking in order to hold the target. The target was tracked in this manner to the maximum tracking range of 30,000 yards. The operators judged the target to be moving at a speed several hundred miles per hour higher than the maximum aided tracking ability of the radar sets. This target provided an extremely strong return echo as well as even though it was at maximum range, however, the echo signal occasionally fell off to a level below normal return. These changes coincided with maneuvers of the target.

This sighting proved to be a weather balloon. How it was determined is unknown but AICG was informed that it was a balloon by AICG-13 telegram TT-257, dated 5 October 1951, USAF Iter 11, which stated: "Radar sighting was later identified as weather balloon. Target track was vertical. Later exploded and descended to ground."

4. On 11 September 1951, at about 1330, a target was picked up on an SCR-584 radar set, serial number 311, that displayed unusual maneuverability. The target was approximately over Lakeside, New Jersey, as indicated by its 10,000 yard range, 6,000 feet altitude and due north azimuth. The target remained practically stationary on the scope and appeared to be hovering. The operators looked out of the van in an attempt to see the target since it was at such a short range, however, overcast conditions prevented such observation. Returning to their operating positions the target was observed to be changing its elevation at an extremely rapid rate, the change in range was so small the operators believed the target must have risen nearly vertically. The target ceased its rise in elevation at an elevation angle of approximately 1.50 mils at which time it proceeded to move at an extremely rapid rate in range in a southerly direction once again the speed of the target exceeding the aided tracking ability of the SCR-584 so that manual tracking became necessary. The radar tracked the target to the maximum range of 31,000 yards at which time the target was at an elevation angle of 300 mils. The operators did not attempt to judge the speed in excess of the aided tracking rate of 700 mph.

It is highly probable that this is an example of anomalous propagation as the weather on 11 September was favorable for this type of phenomenon. The students stated that they were aware of this phenomenon, however, it is highly probable that due to the previous sightings of what they thought were unusual types of aircraft, they were in the correct psychological condition to see more such objects.

30 Sept 51

Following is a ~~partial~~ transcript of an interrogation of Lt. [redacted] and Maj. [redacted], of the 148th Fitr-Interceptor Sq., of Dover, Delaware. The interrogation was accomplished by Lt. Col. N. R. Rosengarten and 1st Lt Jerry W. Cummings, 1125th Field Activities Group, Air Technical Intelligence Center, Air Technical Intelligence Command.

The subject matter relates to the sighting of an unidentified aircraft which the subject officers observed on 10 Sept., 1951, while airborne near Sandy Hook, New Jersey.

Although these men had been previously interrogated by the ~~Air~~ ^{ENDIC} ~~Defense~~ ^{STEWART Fld.} Command (Col. Baumgartner of A-2, Newburgh ~~NY~~) the information which was available from this report was not sufficient in coverage to establish the facts of the matter, particularly in regard to the means whereby the information became available to the public. This question was of importance, when it became apparent that the Fort Monmouth radar school received several telephone calls concerning the incident.

Mostly about how story got out

The interrogation follows:

1. The object was first sighted over Sandy Hook, and the information available to the interrogators was verified as true and complete by the subjects.
2. The question of communication of the information as examined as follows:

a. Between 1135 and 1137 on 10 September, 1951, Samworth CGI (CPS-5) became aware of the existence of a fast flying object when inadvertently the intercom communication of the initial sighting by Pilot [redacted] to Maj. [redacted] was transmitted over a radio check-in. It is certain that Samworth heard that there was an unidentified object making 7-800mph because at this time Samworth queried "What was that."

At this time Pilot [redacted] described, giving heading of 120° and an inadvertently incorrect geographic fix of Seaside Heights instead of Point Pleasant. It is believed that Lt. Carr was on GCI and may have acknowledged although this is not certain.

Immediately after losing the object, the T-33 wagon letting down to Mitchell, entered the traffic pattern alone, and landed immediately. The two officers agree on landing time as 1147 EDST.

3. The question of non-electric communication of this information was next undertaken in the interrogation. The officers advised that they had been instructed to release information under certain circumstances, had refused unauthorized sources under others, and that there was only one instance of possible access by persons who ~~xxx~~ were placed to overhear their conversations, as follows:

a. The driver of a carry-all may have heard them say that they saw a rough object at very high speed while he was driving to them from the A7C to operations on landing. The name of the ~~driver~~ ^{OFFICER} is not known, nor is it known that he could hear their conversation over the truck noise.

b. The officers did not render a report of the sighting to the operations officer at Mitchell, nor did they receive a debriefing

since this was a local flight in Z I.

c. The officers advised Col Sprowls and Col Spain, operations and training officers on General Minnie's staff that they had seen a very high speed unidentified aircraft and were ~~laughing and not taking it seriously~~ not advised concerning action. Their only response was laughter. Time 1200, approximately, 10 Sept 1951.

d. Since Maj [redacted] returned to Dover, Lt [redacted], while at Mitchell ops took a call for the major. This call, at about 1500 was from a man identifying himself as Major Barron, public information officer. He stated it was that the subjects saw. Lt [redacted] related location, ground track, description, time of sighting, duration of sighting, and color.

Maj Barron allegedly did not qualify himself except as PIO. He then stated that this sounded like good newspaper story material and that he was sending a newspaper man (newspaper name forgotten) over to operations to get the story from Lt [redacted]. He is further said to have advised Lt. Rogers that he was personally clearing this information for release. Maj Barron did not provide a means of identifying or establishing the individual who was to come to see Lt [redacted]. Then Maj Barron asked how long Lt. Rogers would be at Mitchell and was told some hours.

About half an hour after the telephone call from Maj Barron, a man in civilian cloths (description not recalled) entered operations and asked the operations clerk for Lt [redacted]. Lt [redacted] was at this time looking for the telephone of the base security officer, but failed to find, and did not subsequently report this incident, due to subsequent events.

The civilian introduced himself as a newspaper man, name and affiliation unknown, and stated that Maj Barron had sent him to get a story. He asked what Lt [redacted] had seen.

Lt [redacted] informed the man that he must call Maj Barron to get a repeat on his clearance. This the man did, failing to locate at the PIO office, but succeeding at the officer's mess. The conversation between the civilian and Maj Barron on the other end of the line ended, and the civilian informed Lt [redacted] that everything was all right, that he was cleared to receive the information on the authority of Maj Barron.

Lt [redacted] took the civilian to the operations map, and showed the geographic location of the sighting, the ground track, the elapsed time, the color, shape. They went from the operations map to a sectional-mounted-map near the weather office for better explanation due to larger scale. The civilian asked Lt [redacted] what he thought he had seen, and was told that it was an object which Lt [redacted] had never seen before.

Then the civilian asked if it was a flying saucer and again Lt [redacted] replied he did not know what it was. Then the civilian asked whether it was a weather balloon, and was told no, that the weather balloons cannot travel so fast as the object sighted.

At this point an unidentified civilian, carrying a 4x5 Speedgraphic, w/ flash gun and with lens and bellows open approached and stated that he wanted a picture of Lt [redacted] in front of the operations map. Lt [redacted] stated that the two men behaved as if they were working together, but that they exchanged no greeting and names were not used to his recollection. Then

Lt [redacted] demurred, saying that it was probably illegal for the civilian to photograph the map. The photographer answered that he had many times taken a picture of people in front of this very map, and a picture was taken. A second picture was taken of Lt [redacted] and a Captain (dy officer), posed at a table with the map. The unknown captain did not wish to have his name used, but consented to pose.

The civilians subsequently left.

Lt [redacted] left Mitchell for Dover that evening.

d. On 11-12 Sept 1951, exact date indeterminable at this moment, NBC called Maj [redacted] at Dover from New York, asking for information pertaining to the incident over Sandy Hook. The major replied that he was sorry not to be able to discuss the matter with them, but transferred them to Lt. Payne, the PIO for clearance. Lt Payne later reported that he thought he distinguished wire-tap beeps, and that he refused release, but offered to check on possibility of obtaining release. He called EADF, who called USAF, and the answer relayed by Payne to Maj [redacted] was that clearance wasn't forthcoming, and that the matter should be forgotten.

e. Later, a Lt. East at Dover received a call in operations from Associated Press for Maj [redacted], who told Lt East to say he was not there.

f. On 17 EADF ordered Maj [redacted] and Lt [redacted] to Newburgh for interrogation.

g. About 20 September, 1951, Robert Johnson of Republic Aviation called Maj [redacted] and asked for permission to visit him to discuss the incident they had reported. Maj [redacted] said that he was happy to have them come over but that he couldn't discuss the matter with them unless they received authority for him to talk over. Johnson called EADF, and EADF advised the Dover base CO, ~~Sgt~~ O'Gan that Robert Johnson and Mr Brewster of Republic were authorized to discuss the incident with Lt [redacted] and Major [redacted]. This discussion proceeded with ground track, shape, time of sighting, duration of sighting, color, altitude, and heading. The asked specifically concerning exhaust, and offered several sketches for identification--none were identifiable. The subjects interrogated the interrogators, learning that Brewster was studying the matter, that USAF and WPA FB personnel would soon arrive to interrogate, and that Brewster thought the objects were electrically propelled. Brewster cited names of people that had reported similar objects previously.

h. Until the interrogation reported here was made, there were no further inquiries made of Lt [redacted] or Major [redacted] concerning their sighting of 12 Sept 1951

4. It is perhaps worth mentioning that the additional information received is that the officers have not previously revealed their estimate of speed of 7-800mph to persons questioning, except here, and that only during the inadvertant transmission to Samworth was this speed quoted.

5. Previous reports that Lt [redacted] had determined that Samworth had negative results in attempting to track are negated by [redacted]. Neither he nor Maj [redacted] know whether Samworth tracker or whether Samworth got a return on the object in question.

6 October 1951

The purpose of the information recorded on this wire recording is to present a record of the field investigation accomplished by Col N. R. Rosen-
gatter and Lt. C. W. Cummings between the period of 28 September and 2 October
1951. The material recorded herein is in chronological fashion although some or-
ganization will be introduced in handling the information derived from persons
interviewed in Ft. Monmouth, New Jersey. The trip originated with a receipt
at approximately 1100 at Air Technical Intelligence Center of Teletype No.
440, Teletype Item CSW Item 2. This teletype was sent down from AFOTM-V/TC.
The reported sightings on 10 September 1951 and on 11 September 1951 by
electronic and visual means of unidentified flying objects. Col Kirkland
had been advised early in the morning on 28 September that Gen. J. H. Dyer's office
was desirous of knowing concerning a sighting at Ft. Monmouth, New Jersey.
Therefore, the Project Monitor of "Grudge" Project extracted from the files
information that had been received on the Ft. Monmouth sighting and related
same to Col Kirkland. Now Col Kirkland made a telephone call to Washington
and advised as to stand by that fast action would be necessary on this because
of the General's personal interest. Therefore, a stenographer was alerted
since it was expected that information might be received after working hours
were completed or to work over would be necessary to accomplish the mission
indicated by Col Kirkland. However, no information reached us until 4 P.M.,
quitting time. At that moment, Mr. DeYarnold informed that a message had come
in that they had sought the Project Monitor and that dissemination was being
accomplished in Electronics Branch. Consequently, Col Rosenberger and Lt.

... of the Department went to the Electronics Branch and ...
... that the stated ... and arrived some yards in length and it was ...
... by Electronics Branch and Mr. Zimmerman. The decision was ...
... after that meeting was broke so that we had been delayed already ...
... and we might as well get into the field because information neces- ...
... for evaluation was not present in the communication from TCB and that ...
... other information seemed likely to be had. The decision was then submitted ...
... request in the subject telegram CSAF Item 2 as follows. It is advisable ...
... to make an evaluation of these incidents recommend a full investigation to ...
... obtain a complete report of the incident and related circumstances. Evalua- ...
... tions and conclusions should be forwarded to this Hq by teleconference. Im- ...
... mediate investigation must be made. Findings must be related immediately to ...
... this Hq not later than Monday, 1 October 1961. Following information concerning ...
... these instances is quoted for preliminary analysis to be made immediately for ...
... Col. DeBell and then MAUS. Ho, Stewart Air Force Base interrogations concerning ...
... radar and visual sightings are quoted. Now Col Kirkland was contacted and ...
... travel orders were written at a late hour in the evening so that Col Rosen- ...
... garten and Lt Cummings boarded a TWA airplane for New York at about 11:00 ...
... that night. About 10 o'clock on Saturday morning Lt Cummings and Col Rosen- ...
... garten reached Ft. Monmouth, New Jersey, and contacted their G-2 of the Signal Corps ...
... station, Ft. Monmouth. Arrangements were made to begin immediate interrogation ...
... of personnel concerning electronics sightings through the cooperation of G-2, ...
... Base Commander, acting through Col Marmore. The persons interrogated were as ...
... follows: PFC ... Pvt ... Pvt ... Pvt ... Mr. ... Mr. ...

Capt. [redacted], Lt. [redacted], Col. Murrain; Agent DeBorne; Agent and Chief
[redacted] and consequently, Lt. [redacted] and Major [redacted] of Dover
Air Force Base pilots concerned; Major Markin, Commanding Technical Officer
of Twin Light Radar Station, Staff Sgt. Hall, Monitor radar box channel, Twin
Light Radar Station, and incidental individuals. Reference to basic GFAS,
Item No. 2 of the teletype of 28 September 1951 will show the names of

[redacted] These individuals were concerned with operations of
radar stations from which signals were seen on 10 and 11 September. Now the
significant fact learned at Fort Monmouth was that the students were operating
radar sets in a training center that these students were not connected with
practical operations. They maintained no plotting records and they did not
plot and did not log any of their findings. Circumstances were basically
that as students who were being trained in maintenance at this training fac-
ility and that as instructor put certain mechanical or electronic difficulties
into radar sets of the CR 584A Type. The students were charged for deter-
mining the malfunction causes and eliminating these causes. If the students
were successful in eliminating the causes and peaking their set to higher
radiation efficiencies, early in their phase of the program associated with
these sets, they were permitted to operate the sets much the same as a tactical
operation for the balance of the period to which they were assigned to a parti-
cular set. This is an important item in connection with the following interro-
witness in that three students were assigned to each set and these three students
were required to operate alone, not providing a man for allowing or coordinating
of sets. It was considered incidentally desirable by the students to operate
the sets as a sort of privilege and they attempted to do this whenever possible.

Not some of these students had backgrounds which were suitable as scientific subjects for interrogation and others had a lack of such backgrounds. As an example one individual PFC [redacted] was found to have language difficulties and little or no formal education background. On the other hand, however, PFC [redacted] was a mathematics major at Massachusetts Institute and Technology and would have graduated in the class of 1951 in the spring if it had not been for his untimely induction in the fall of 1950. Although [redacted] was interrogated along with [redacted] others with qualifications as bad as [redacted] or worse were not interrogated in that it was considered their value was not commensurate with the time required to talk to them. However, persons were contacted from each set cited in CSAP, Item 28 No. 2 so that a representative study of the findings were had. The time element is important and will be considered with [redacted] this moment. All operation of the radar sets by the students ceases at about 11:20 a.m. in that lunch formation begins at 11:30. Even though the students may be interested in what they are reading on the scope, they may not continue their operation practice hour because of military requirements. Further, the time is of particular insignificance to the students excepting in a hour in that they are in a crowded schedule and this is a typical psychological problem of a student in a military course. They cannot even remember the days with accuracy although considerable time was spent to get independent statements from them in this concern. There are two exceptions to this state of events existing in the persons of Mr. [redacted] a civilian instructor for their students who has actual practical experience in World War II operation of radar sets in Florida. A second individual is PFC Crop although he has no tactical experience from World War II has similar practical experience

... instructor at Fort Monmouth where he is actually
... was operating an MPG type set
... are somewhat
... than that of the students. No purpose seems to be served
... of the interrogations of these men but rather we will
... to the items of ISAF Item No. 2 in order to discuss the influence of
... the interrogations on the material presented in these items are the basic
... teleconference telecon Item No. 1, September 10, 1951, ~~...~~ PG-1 radar
... picked up a fast moving low flying target, etc. This is ~~under the auspices~~
... under the operation of PFC Clark at that time. PFC ... was operating the set
... at that time. This set has a nominal range of 12 to 14,000 yds., the
... set is zeroed to azimuth using a compass on stakes so that 0° for a set in
... azimuth is magnetic north field approximately with experimental error of the
... situation may set it upon. PFC ... was making a demonstration for some
... technical officers at the time he observed Item No. 1. It was
... to obtain a target to lock the target in an automatic semi-aided
... and to demonstrate this feature as such, he is successful almost as
... as he started the demonstration of finding a saturation echo on a PPI scope
... with almost constant target heading on attempting to lock in a aided tracking,
... however, he was considerably frustrated by the fact that the aided tracking
... would not keep up with the object. After several attempts to maintain aided
... of this target, he determined that the speed was too high for aided
... of about 700/hrs. Because of the circumstances of the demonstration he
... quickly tried to pass to another target and was finally successful in demon-
... strating a ground target, namely, the Highlands which lie between the station

III. CONCLUSIONS

UNCLASSIFIED

A. The unidentified aircraft reported by the T-33 pilots was probably a balloon launched by the Evans Signal Laboratory a few minutes before the T-33 arrived in the area.

B. The 1110 ELSI radar sighting on 10 September 1951 was not necessarily a very high-speed aircraft. Its speed was judged only by the operator's inability to use aided tracking and this was possibly due to the operator being excited, and not the high speed of the aircraft.

C. The 1515 ELSI radar sighting on 10 September 1951 was a weather balloon.

D. The 1050 ELSI radar sighting on 11 September 1951 was a weather balloon.

E. The 1330 ELSI radar sighting on 11 September 1951 remains unknown but it was very possible that it was due to anomalous propagation and/or the student radar operators' thoughts that there was a great deal of activity of unusual objects in the area.

UNCLASSIFIED

and New York City. Interrogator regarded anomalous propagation involving trapping effects and gave negative indications and was verified by other personnel. Weather shows that September 10 in that area was not one favoring anomalous propagation but the September 11 was. We have indications evidenced by PFC [redacted] was that ground quarter was of a normal nature and was not extending inside of 5,000 yds. prior 3 centimeters set of the MFG type or others were in operation in the area at that station to the knowledge PFC [redacted] and other personnel there which eliminates interference effects. Note that no pit shape may be discussed here in order to fix the current size of target because of the use of the PFI scope alone and aided tracking was not possible. PFC [redacted] began operation of this instance at approximately 11:15 and the operation was ended by 11:18 approximately. This is EUSF. Maximum duration of sighting approximately 3 seconds at one time although 45 seconds in a row. It could not be verified 10 September 1951 was fixed in the telescope, however, the student with reference to other events would fix this as 11 September ^{or} 12 September. This is given a low evaluation. It is believed, in fact it was on September 10. The MFG set had been in operation since 1100, that is warming up, for 15 minutes before the demonstration began in which the target was picked. This story, interrogation by PFC [redacted] was high azimuth rate target traveling north bound up the Jersey course from [redacted]. It was lost near Sandy Hook, he said. Following the course line changing the range only slightly but changing azimuth rapidly. The target was lost in the northeast at a range of 14,000 yds. Operator initially identified the target as a ship and then realized it could not be a ship. PFC Clark upon interrogation stated that he intended to say operator "and a target" but location of ship is usually found and realized it was not

a. a/c. Now finding ^{of} reinterrogation of PFC independent of the pre-
viously accomplished one indicated azimuth variation from 315 to 205°, remember
this is magnetic. Notice that the stories are radically different, and it is
the opinion that consequence of firm statements by PFC one must conclude
that the track is not that specified by CSAF Item No. 2 nor are they the track
which begins at a heading of about 315 magnetic and changes continuously to
about 205 magnetic. This would put the track very similar to that of the object
observed by Major and Lt , airborne at about that time. There is
no more significant information to report of CSAF Item 2, subparagraph 1.

Reference paragraph 2 stating on 10 September 1951, 1515 hours ANSCR 584
- T-33 (shortly before track target, etc. It is given an A-1 evaluation that
this target was a balloon. It was tracked at the request of the Commanding
Officer of the Student Attachment to determine the altitude in order to es-
tablish who won a pool concerning what the altitude of the balloon which is
sighted might be. The pool was formed by several officers at a risk of \$1 a
head concerning this target. It is a significant feature here which ties in later
with the distribution of balloons. So much for Item 2, Paragraph 2.

Paragraph 3. On 11 September 1951 at 1050 hours, two SCR 584 Serial costs
217 and 315 picked up the same target north of Ft. Monmouth at an ^{elevation angle} ~~azimuth~~
of ³¹⁵ 315 to 106 miles range of 30,000 yds., etc. The interesting part of this
sighting is that it was inspired by alert which was traced to newspapers. It
involves further Mr. the instructor previously mentioned and Pvt
the MII graduate, previously mentioned, Pvt and a crew of two other
men were training a radar set which was in operation at the particular moment
just prior to the signal received at 1050 hours. The instructor, Mr. was

advised that he should put all sets into watch in the search in order to watch for unidentified flying objects. In order to do this, he had another instructor point out directly to his students and advise them that they should search at once for unidentified flying objects. Pvt. [redacted] and the other two men were among the students who were notified. Another instructor went directly to SCR [redacted] No. 217 put it on the air. It had previously been warmed up that morning. [redacted] at once Pvt. [redacted] and his crew announced to Mr. [redacted] that they had a target high speed and strong. Mr. [redacted] investigated and observed the target himself on the scope, noticed the azimuth and went directly to set 217 searched in the proper azimuth for the same target and soon succeeded in finding it. Indication of a target of greater than B-25 size generally of the B-29 size interrupted distinguished from a B-36 size aircraft. Mr. [redacted] had personally tracked on several occasions and could distinguish, he said, from a balloon stating that it was definitely not a balloon he had in the scope. Target first appeared at 20° azimuth and varied 250 to 50 in azimuth. During turns the tip would diminish in the manner which was characteristic of jet aircraft at that range. He put the scope on tracking because they would keep the target in sight tracking by assisting the operation by applying torque to the hand wheel. G-2 [redacted] whose age is 31 is at least a [redacted] reliability. He is cleared for Secret, however, other weather information showed existence of fronts lying out from Fort Monmouth in such a nature with the radar load projecting downwards would give signals somewhat like the type observed. It is not an evaluation. There is not sufficient data from which to make an evaluation. Only the indications are given here. Very little sensible information could be

elicited from Pvt. [redacted] and his crew due to the difficulties of time having elapsed and the students being confused by their training program, speaking specifically of a rigid detail and routine to which they are subjected. This should not be construed to be a criticism in that their technical capabilities seem to be unusually great for students showing that their training courses is likely a very good one. Notice that paragraph 3 of basic communication includes two unrelated reports. Pvt. [redacted] and his crew are identified with No. 4, SCR Serial No. 315. Mr. [redacted] identified with this Serial No. 217, Item 3. Now it is proper to discuss SCR Set Serial No. 315 of Item 3 identifying this was Pvt. [redacted] and his crew. Pvt. [redacted], Pvt. [redacted] of this crew were interrogated. It developed that Pvt. [redacted] was operating the set alone at the time he picked up the signal. He did not relate the information that morning to his fellow students but rather waited until that afternoon. Although they were within easy hearing distance at the time he identified the target on the scope, the situation is too confused again in this instance to state specifically any findings. It may be concluded, however, that weather could have had a definite effect upon this target as well. Some question may be introduced concerning why Pvt. [redacted] would fail immediately to notify his fellow members of such an unusual target had he seen it and indeed not mention it during the lunch but wait until that afternoon late in order to reveal it. It is not to be construed as an evaluation again. There is not sufficient data to arrive at a conclusion. The time to be ascribed to paragraph 3 should be approximately 1037 EDST. Interrogation of the student personnel occupied Saturday, Saturday night, and Sunday during part of Sunday afternoon. Much time was spent attempting to fix

with greater detail dates, time, and circumstances in order to find something of value. However, it was realized after all this was accomplished, it had been in vain, absolutely too much time had elapsed for human memory to recover the detail necessary for further evaluation. Then, the two pilots, Major [redacted] flying as observer, and Lt [redacted] who was flying as pilot of a T-33, sighted an unidentified flying object and they flew into Fort Monmouth for interrogation. The story was verified, questioned, analyzed, discussed, and the pilots remained firmly convinced of the details which they had sighted. However, certain circumstances were indications that they did not possess the detail which they claimed concerning a track of the flying object they claimed to have seen. They were interrogated at great length concerning the circumstances whereby this report concerning the flying object they saw reached the press and also a request was [redacted] signed for investigation of the base PIO officer at Mitchell Air Force Base, a Major Barron, in order to clarify his part in the activity. It is sufficient to state that neither [redacted] or [redacted] made a voluntary statement to press and that [redacted] made his statement to the press only when he was directed to do so by Major Barron, Base PIO, and this is according to [redacted] statement only. An interrogation of the personnel at Twin Lights Radar Station was undertaken and it was learned that Twin Lights was off the air at the time the sightings occurred on 10 September. Visual and radar sightings are referred to in this instance. Operating hours at that time at Twin Lights were 0400 to 0800 and 1730 to 2300 EDT. Therefore, there is no verification from Twin Lights loss of the sighting one way or the other. However, Staff Sgt Pallock who was monitoring channel 10 at the

station overheard, a radio check and ~~conversations~~ ^{conversations} between the pilots which is discussed in detail in other reports inclosed in the folder. He reports that the ~~conversations~~ ^{conversations} was an ~~excellent~~ ^{excellent} one and verified roughly the statements and ~~made~~ ^{made} concerning what they revealed over the air. He fixed the time as ~~only~~ ^{only} about 11:45 MST and could not fix the date. Fallock is evaluated "A" by his personnel. He is cleared for secret. Dr. Bennett was queried concerning possible activities of a countermeasure station in which he works which might have an effect of giving spurious signals to radar sets operating in the area. His answer to these proposals were unqualified negative. He was interrogated by Col Rosengarten and his report is filed in the project folder. Mr. Hoffman, Capt McNicholas, Agent DeBorn, Agent-in-Chief Reid, were all interrogated concerning the circumstances of alerts which were given student operators at that station. Mr. Taylor is not recorded here as available in the project's record folder. Major Martin is Commanding Officer of Twin Lights and gave the information of the hours of which the station was on the air. With some seven hours of sleep, and one or two meals, the ~~infield~~ ^{infield} party, that is Col Rosengarten and Lt Cummings chartered an airplane at Redlands Airport for Washington, D. C. at approximately 1:30 P.M. reaching Washington at approximately 3:30 P.M. in time to brief Gen. Gabell's staff and to give a very preliminary rundown of what had been accomplished, to Gen. Gabell himself that evening. The airplane was chartered because although the Signal Corps attempt to use their liaison airplane to take us to Washington, the liaison airplane was torn down for periodic inspection. It would have been necessary to wait until the next day had rail or other transportation been

relied upon. Work continued in Washington and Gen. Gabell wanted to be briefed on Tuesday in detail. We checked with Col Kirkland and learned that he wished us to leave behind in Washington as short and incomplete a record as possible pending our firm commitment to Washington as a power of center commitment at a later date after we had the opportunity to study the data in detail. This we were successful in accomplishing. We did have the work in Washington on Tuesday morning and afternoon in order to determine the possibility for balloon and experimental aircraft situations as the incident reported. Balloon results were, until after we left Washington, negative as were experimental aircraft possibilities. Agencies contacted with this respect were Gen Mills, a Mr. Dalein in Minneapolis, Minn., a Mrs. Whedden of the Signal Corps Research Development Center in the Pentagon, Dr. Jack Holloway, and Dr. Lydal of the Office of Naval Research, Major Vickbena of Moby Dick Project in the Pentagon, and others incidental in discovering the identity of these project monitors. The weather bureau was contacted for the weather report. Command Post personnel were contacted to determine whether any reports from the Eastern Air Defense Command might have reported any sightings which we did not have. These results were negative. Persons contacted include: Col Lamber, Eastern Air Defense Command, AC&W Officer, at the Pentagon; Col Conroy, Command Post Commanding Officer; Lt. Col Hubber, Command Post Deputy; and personnel in the message centers. The following conclusions were left with Gen Gabell's staff, Hartford and Bait, and qualified to them as particularly preliminary conclusions. Reference to the telecon message again CSAF Item 2, paragraph 1, was nothing to the moment. We are attempting to get more

basic information which applies possibly in with the airborne sighting.

Paragraph No. 2 (a) 1 balloon because:

- a. Constant altitude.
- b. Slow variation in azimuth.
- c. Visual observation about the same time at the same altitude

by a group of officers.

- d. Motive as to the cause for search for that balloon was established as an order from the Commanding Officer of the student attachment.

- e. Pip size checks with balloons.

3. Target echoes as described bear the characteristics which closely resemble aircraft. It is based on what we have now. We can't add anything negative. Although it resembles an aircraft, it is not impossible that it is caused by weather phenomena. It is of bleak waves.

4. Weather possibility exists as follows:

- a. Stationary target when first detected giving rapid altitude change offers us one solution that fits.

- b. It is to be qualified, however, that weather is not as plausible an explanation of a track of 10,000 yds. continuously at 700/mph over ~~range~~ to 32,000 yds. range. It is to be mentioned however, that more accurate experienced observations than those of the students would be required to identify any points of similarity in the actual appearance of aircraft returns. Students were able to yield primarily only information concerning the motions of the pip. However, as most preliminary conclusions offered this staff, the airborne sighting of 1st Lt [redacted] and Major [redacted] follows:

There are counter-indications that it is an attempt by these two officers to gain publicity in that transmission by the pilot to Sansworth were monitored by Twin Lights and it was definitely reported by the monitor that the pilots were excited in describing something which they believed to exist from the sound of their voices. A ground track was established by reference to interrogation a chart made by airborne by Lt . It is believed that the ground chart which he recorded on that map is correct as the pilots consider it. No statement was made as to whether the pilots are correct but only as they consider it. The range involved cross-section by observation from greater altitude against geographic points on the ground. Upper limited range could thereby be established. A size was reported 30 to 50 ft. in diameter is not a fixed or reliable value. Lt will admit a larger size even up to B-17 dimensions. As to speed, and could not fix a value. They quote only their ground track against the sighting time that is 30 to 50 nautical miles in about two minutes. This shape oblate spheroid the color silver. There were no more observations which we could offer the staff. At the time of this recording, conclusions are something as follows: From the interrogation of Lt , the T-33 pilot, (a) the subject was circular in shape changing after banking to elliptical. Conclusion: Oblique spheroid in shape the object bank in turning. (b) The object was silver in color. Pilot was firm that the object did not reflect the sunlight brightly. (c) The object covered 35 to 50 miles during a two minute period of observation. Conclusion: That with an allowance for misinterpretation, the object makes good speeds greater than 700/mph. (d) The object cannot be fixed for size except within the lower

bound of 35 ft diameter and upper bound of 8-17 diameter. (e) The time of sighting was 11:35 EDST and the object was lost at 11:37 EDST, on 10 September 1951. However, all the foregoing observations concerning the conclusions from the interrogation of Lt [redacted] are in the assumption that it is impossible to demonstrate this criteria necessary to establish their sighting as one of a balloon. Now these criteria are considered to be something like the following:

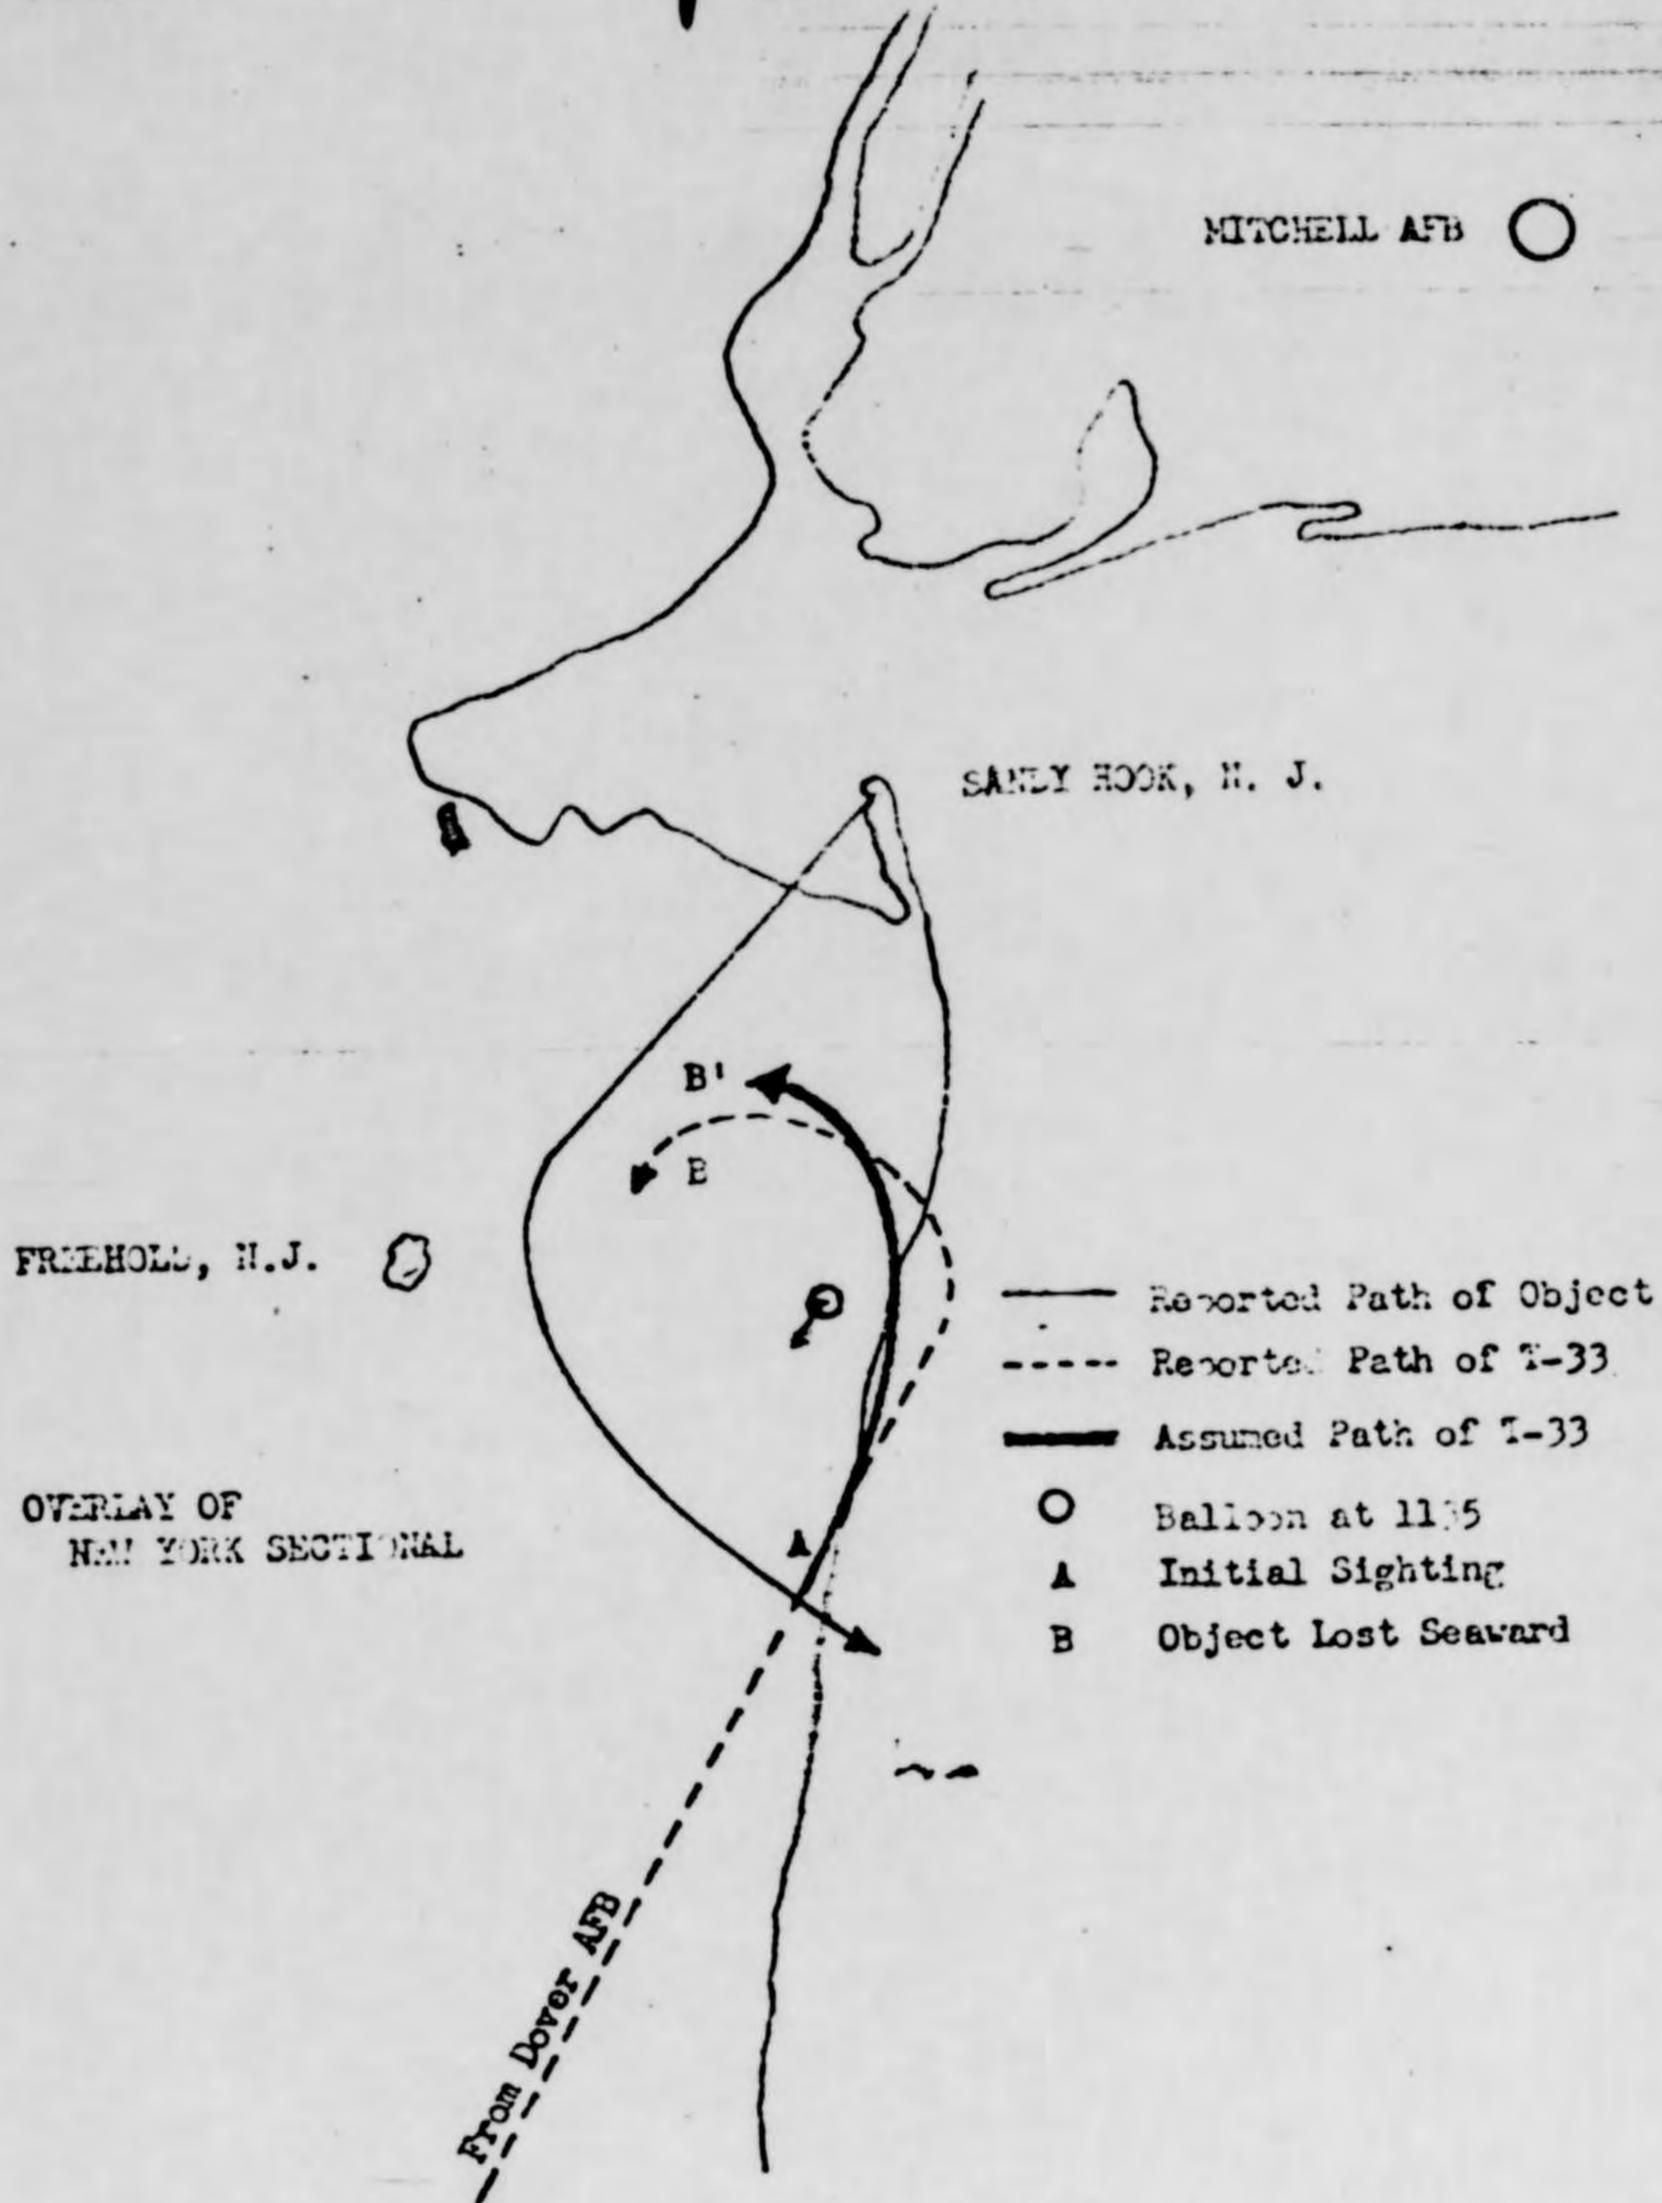

a. Opportunity - that is the presence of a balloon in that geographic area.

b. Similarity - that is points of similarity between balloons and observations made.

c. Absence of a negative component - that is, the pilots themselves verified as a balloon or the subjects who were viewing from the ground did not see a balloon or did see a balloon. However, this could be elaborated upon. It is believed that essentially that these factors would affect the decision. Now as to opportunity, we have information that the Evans Signal Laboratory released two balloons at 11:12 EDST 10 September, that these balloons were in the air until 12:32 EDST on 10 September and that they burst at 104,000 ft and the diameter of the balloons at burst were 39 ft approximately. It is to be noticed that Evans Signal Laboratory is located at Belmar, N. J. It is considered that opportunity is presented in the time element and in geographic locations regarding points of similarity the following must be considered:

Considering that the pilots disagreed radically, interrogations of A-2 of the EADF and interrogations by ATIC personnel as in their written statements concerning ground track that they are not sure of more than this fact that the

object was always on their left and that they did not or did assume a parallel heading. Mathematically speaking, this is to say that the object was going in the same direction as the T-33 aircraft was turning and that the object is following a course such that it is always leading the aircraft, that is, out of phase with it, or that the object is traveling in phase inside the circle of the aircraft and indeed that it may even be stationary inside the circle of the aircraft. It is to be noted that the interpretation that the object always lay on the left of the pilot may be that the object was a balloon stationary inside their turning circle. It is also to be noted that the pilots are not sufficiently sure of the ground track to negate this and a calculation concerning what the altitude of a balloon must be are unnecessary and impossible in that the accuracy of the pilot's report is an extremely questionable thing. In fact, there is indication that they cannot fix the alleged ground track of the object within 10 nautical miles. Note that in terms of speed, this means ten nautical miles in two minutes or five nautical miles per minute or 300 knots per hour if one takes the extreme error between the two observations of ground track. A point of similarity is that balloons are silvery painted for radar purposes when released from Evans Signal Laboratory. So recon was reported by the pilot. A point of similarity is the shape viewed under proper circumstances that the balloon might have an oblique spheroidal shape. In the light of this information, it is considered that there is strong possibility that the sighting was that of a balloon. However, if it can be disproved without recourse to metaphysics that the object was not a balloon, then it should be considered that the four conclusions previously are essentially those which we can stand firmly upon.

SOURCE: Airman

ACTION OR COMMENTS: No investigation

DESCRIPTION OF INCIDENT: Brilliant white light at a low altitude. Was generally stationary.

AIR INTELLIGENCE INFORMATION REPORT

FROM (Agency) Intelligence, 3605th Nav Tng Wg, Ellington AFB, Houston, Texas	REPORT NO. IR-5-51	PAGE 1 OF 1 PAGES
--	-----------------------	-------------------

Statement of Sgt. [REDACTED] 149TH ACBW

At about 0415, 1 October 1951, my infant son woke me up wanting to come to my bedroom. When he came down to my room there was a very bright light right outside my window which is on the East side of the house. I live about three-fourths of a mile North West of Webster, Texas. The object seemed to be semi-stationary. When I first saw it at about 110' from my window and about one-half a mile away and 400' to 500' altitude.

I did not go back to sleep and observed the object until about 0700 at which time it disappeared by rising almost vertically. The time it began rising was about 0630. During the time of observation the object moved up and down like a yoyo about a half dozen times. The range of ascent and descent was approximately 100 feet.

One time (about 45 minutes to 1 hour after I first sighted the object) it went north at a very high rate of speed similar to rate of movement of a humming bird. It went approximately 1/2 mile north then returned to same relative position at a lower altitude.

The light was so bright that I was unable to see any shape or form, but the object seemed to be sending out constant rays of light similar to a diamond glittering. There was no smoke nor sparks as if a fire was burning. There was no sound. The light was the most brilliant, whitish-blue light I have ever seen. The main light was approximately 12 inches across and total size including rays, was about 3 or 4 feet, in diameter, although the rays cause the shape to appear to vary. I was first observing the object through a window screen, but at about 0530 I went outside my home and observed the object for about 30 minutes.

At 0430 I woke my neighbors to use their telephone. I phoned the base to get someone to come see the object. The Base Telephone Operator gave me O.D.'s number, but phone was answered by the Base C.Q. who said OD was not available. I told C.Q. reason for my call and he suggested I call Base Operations then had my call transferred to Base Operations. A Sgt. answered the telephone at Base Operations and said A.O. was not available. I told the Sgt. what I was seeing and he said in so many words-"All I can tell you is that Wright Patterson is experimenting with a project that involves Ellington".

Witnesses other than myself were my wife, Mrs. [REDACTED] and my neighbor, Mrs. [REDACTED].

COMMENTS of Reporting Officer:

1. Informant is NCOIC of Security for his section. He is 27 years old, an intelligent appearing person who doesn't appear to be highly excitable. His story was told in a calm straightforward manner. He is a rated civilian pilot (license No. [redacted], rated commercial pilot, Ratings - Airplane Single & Multi-Engine land, Flight Instructor - Airplane).

2. A further check with M/Sgt. [redacted] at Base Operations revealed a Pfc. [redacted] was on duty at Base Operations at the time Sgt. [redacted] called the Base. An information copy of Sgt. [redacted]'s statement was given to S/A [redacted], local U.S.I. Detachment, who asked that Pfc. [redacted] not be contacted regarding his statement about the Wright-Patterson experiment that involves Ellington Air Force Base until his (OSI) office gets an answer to a check they are making.

3. A check of the Air Almanac showed Venus to have been in about the same compass position of the object seen by informant at the time covered by this report.
