HYDROGRAPHIC BULLETIN

METEORS

The Hydrographic Office is cooperating with astronomers who are studying meteors. Mariners reporting their observations of these bodies are greatly assisting in this work. It is desired to have the Greenwich time and point of appearance and disappearance as accurate as possible, either by bearing and altitude, or by relation to fixed stars, or both.

Complete observations on long-enduring trains and their direction of drift are of especial importance, as they determine wind direction in the upper atmosphere.

NORTH PACIFIC

Second Officer C. A. Olver of the American SS. *Hawaiian Refiner*, Capt. H. O. Matthiesen, Master, reports that at 1512 G. M. T., November 29, 1953, a large meteor was observed which appeared at an altitude of 20° bearing 290° . The meteor, which was greenish in color and a little larger than *Jupiter*, moved slowly from west to north in a slight downward direction and then became brighter, breaking in two, the smaller portion falling rapidly. The phenomenon was visible for approximately 7 seconds.

Weather clear, wind northerly force 1, barometer 30.34 inches, air temperature 66° F., wet bulb 63° F.

30 Nov 53
N ATLANTIC

Hydrographic Bulletin

NORTH ATLANTIC

Second Officer Julio A. Lopez of the Argentine MV. *Rio Lujan*, Capt. D. Carabelli Montero, Master, reports the following observation:

On November 30, 1953, at 0154 G. M. T., in lat. $7^{\circ}49' N.$, lon. $25^{\circ}33' W.$, a very brilliant meteor was observed. The body appeared at 55° altitude and disappeared about 2 seconds later, leaving a very brilliant greenish-blue trail that glowed for about 4 minutes after the meteor's disappearance.

Sky partly cloudy, wind NE. force 3, barometer 29.94 inches, air temperature $80^{\circ} F.$
