STRANGE ROCK HITS CAR ON NEW JERSEY HIGHWAY: A rock or meteorite the size of a softball hit a 5-year-old girl riding in a car on the Pulaski Skyway near Newark, New Jersey, last Feb. 4th. The rock crashed through the windshield and careened off the little girl's chest, nearly causing her father, John Watson, to lose control of the car. The object was identified as a meteorite by officials of the Newark Weather Bureau. A mineralogist said that the specimen contains copper and nickel, not ordinarily found in meteorites, but also not usually found in rocks of north Jersey. An official of the Museum of Natural History in New York identified the object as an ordinary piece of slag, and denied that it could be a meteorite. The case was investigated thoroughly by August W. Roberts of Jersey City, who is a saucer researcher of our acquaintance. Due to the differing opinions of the various experts that were consulted by Mr. Watson and by Roberts, no final conclusions can be reached.

6 February 1956
Salmon River, California

Mr. John Wiley, Chilko, Charles Brewster and R. "Doc" Shoup observed strange "flying object" at 8 P.M. They said they saw something from what appeared to be a fan like tail and the object remained stationary in the atmosphere for one half hour then it moved northward and lingered for 15-minutes before it dis-

CLOSE SIGHTING MADE BY A COUPLE DRIVING ON JERSEY SHORE:

A couple, who refused to allow their names to be used in the papers, stated that on the night of Feb. 6th they watched a saucer do maneuvers over their car for nearly half an hour, while driving near Somers Point, New Jersey. The woman said that at one time the object was so close above them that "a good rifle could hit it." She said that it seemed round but because of the angle it was shaped "like a kidney bean." Sometimes it stood still, and then would move slowly, quickening its speed until it was soaring "faster than a jet." It appeared to be made of metal. The wife added: "Sometimes it would come toward me, and there would be a bright light in the center and a glow around it. At other times it would go straight up in the air with a bright light above it and a glowing tail below it. Sometimes it would stand still awhile, then suddenly dart away." (See also page 10, column 2, and page 11, column 1.)

UFO* NEWS

1956

*Official U.S. Government Disposition by Government Photo Office

(EDITOR'S NOTE — This is the second in the series of our somewhat revamped "UFO News" section. Needless to say, we appreciate the cooperation of those many individuals who have been kind enough to send us newspaper clippings and accounts of personal sightings. News clippings should include the date and origin, while personal reports should contain as many details as possible. Thank you.)

* * *

Feb. 12—Noel, Missouri—Newspaper editor Bob Sterling and his family observed two UFO's shortly before sundown. He described: "The two objects were elliptical in shape, appeared to be at a great distance and were first sighted north of the setting sun. They moved slowly to the southwest and finally disappeared over the horizon. They appeared to be rather large in size and were silvery in color much like reflection of the sun on aluminum. Both moved in the same direction and stayed the same distance apart. Mrs. Sterling said when she first saw the two of the objects appeared to give out a flash." (Noel Daily News.)

14 February 1956
Vallejo, California

[REDACTED]—Vallejo, Calif.—The Rev. William Moore, O.P., an amateur astronomer, saw a "bright and perfect" flash across the western sky at 8:15 p.m. last night. The "second or less" was described as a huge red flash—like a burning plane, except that it disappeared while still above the horizon. It was something like a large shooting star, very red, and with a slight tail of flame. It was five or six times larger than any star in the sky.

15 February 1956
Vancouver, B.C., Canada

FIG. 15—Vancouver, B.C., Canada.—Mrs. Walter Pinches sighted "a bright red disc at least a couple of thousand feet up and moving faster than a plane" late that night. She related that "it disappeared west behind Little Mountain in about a minute. It was bright and clear but made no sound." Another witness reported "a fast moving silent light, traveling east on level trajectory" earlier in the evening. (Vancouver Province, 2/26; Miss D. Clark.)

16 February 1956
Santa Barbara, California

PHOTO 14-Santa Barbara, Calif.—"A large object, vari-colored
and the size has as logs burning in a fireplace," which moved slowly
over northern mountains, was observed by Mrs. Jacqueline Bruin
at 5 p.m. The UFO, visible "for at least two minutes...until it
disappeared behind a cloud," trailed "a luminous, 'pinky colored'
cloud" that "changed shape and began looking more like a smoke
ring or a comet and grew larger," Mrs. Bruin said. (Santa Bar-
bara News-Press 2/17)

**original source of photo unknown (photo taken
during Air Show--)**

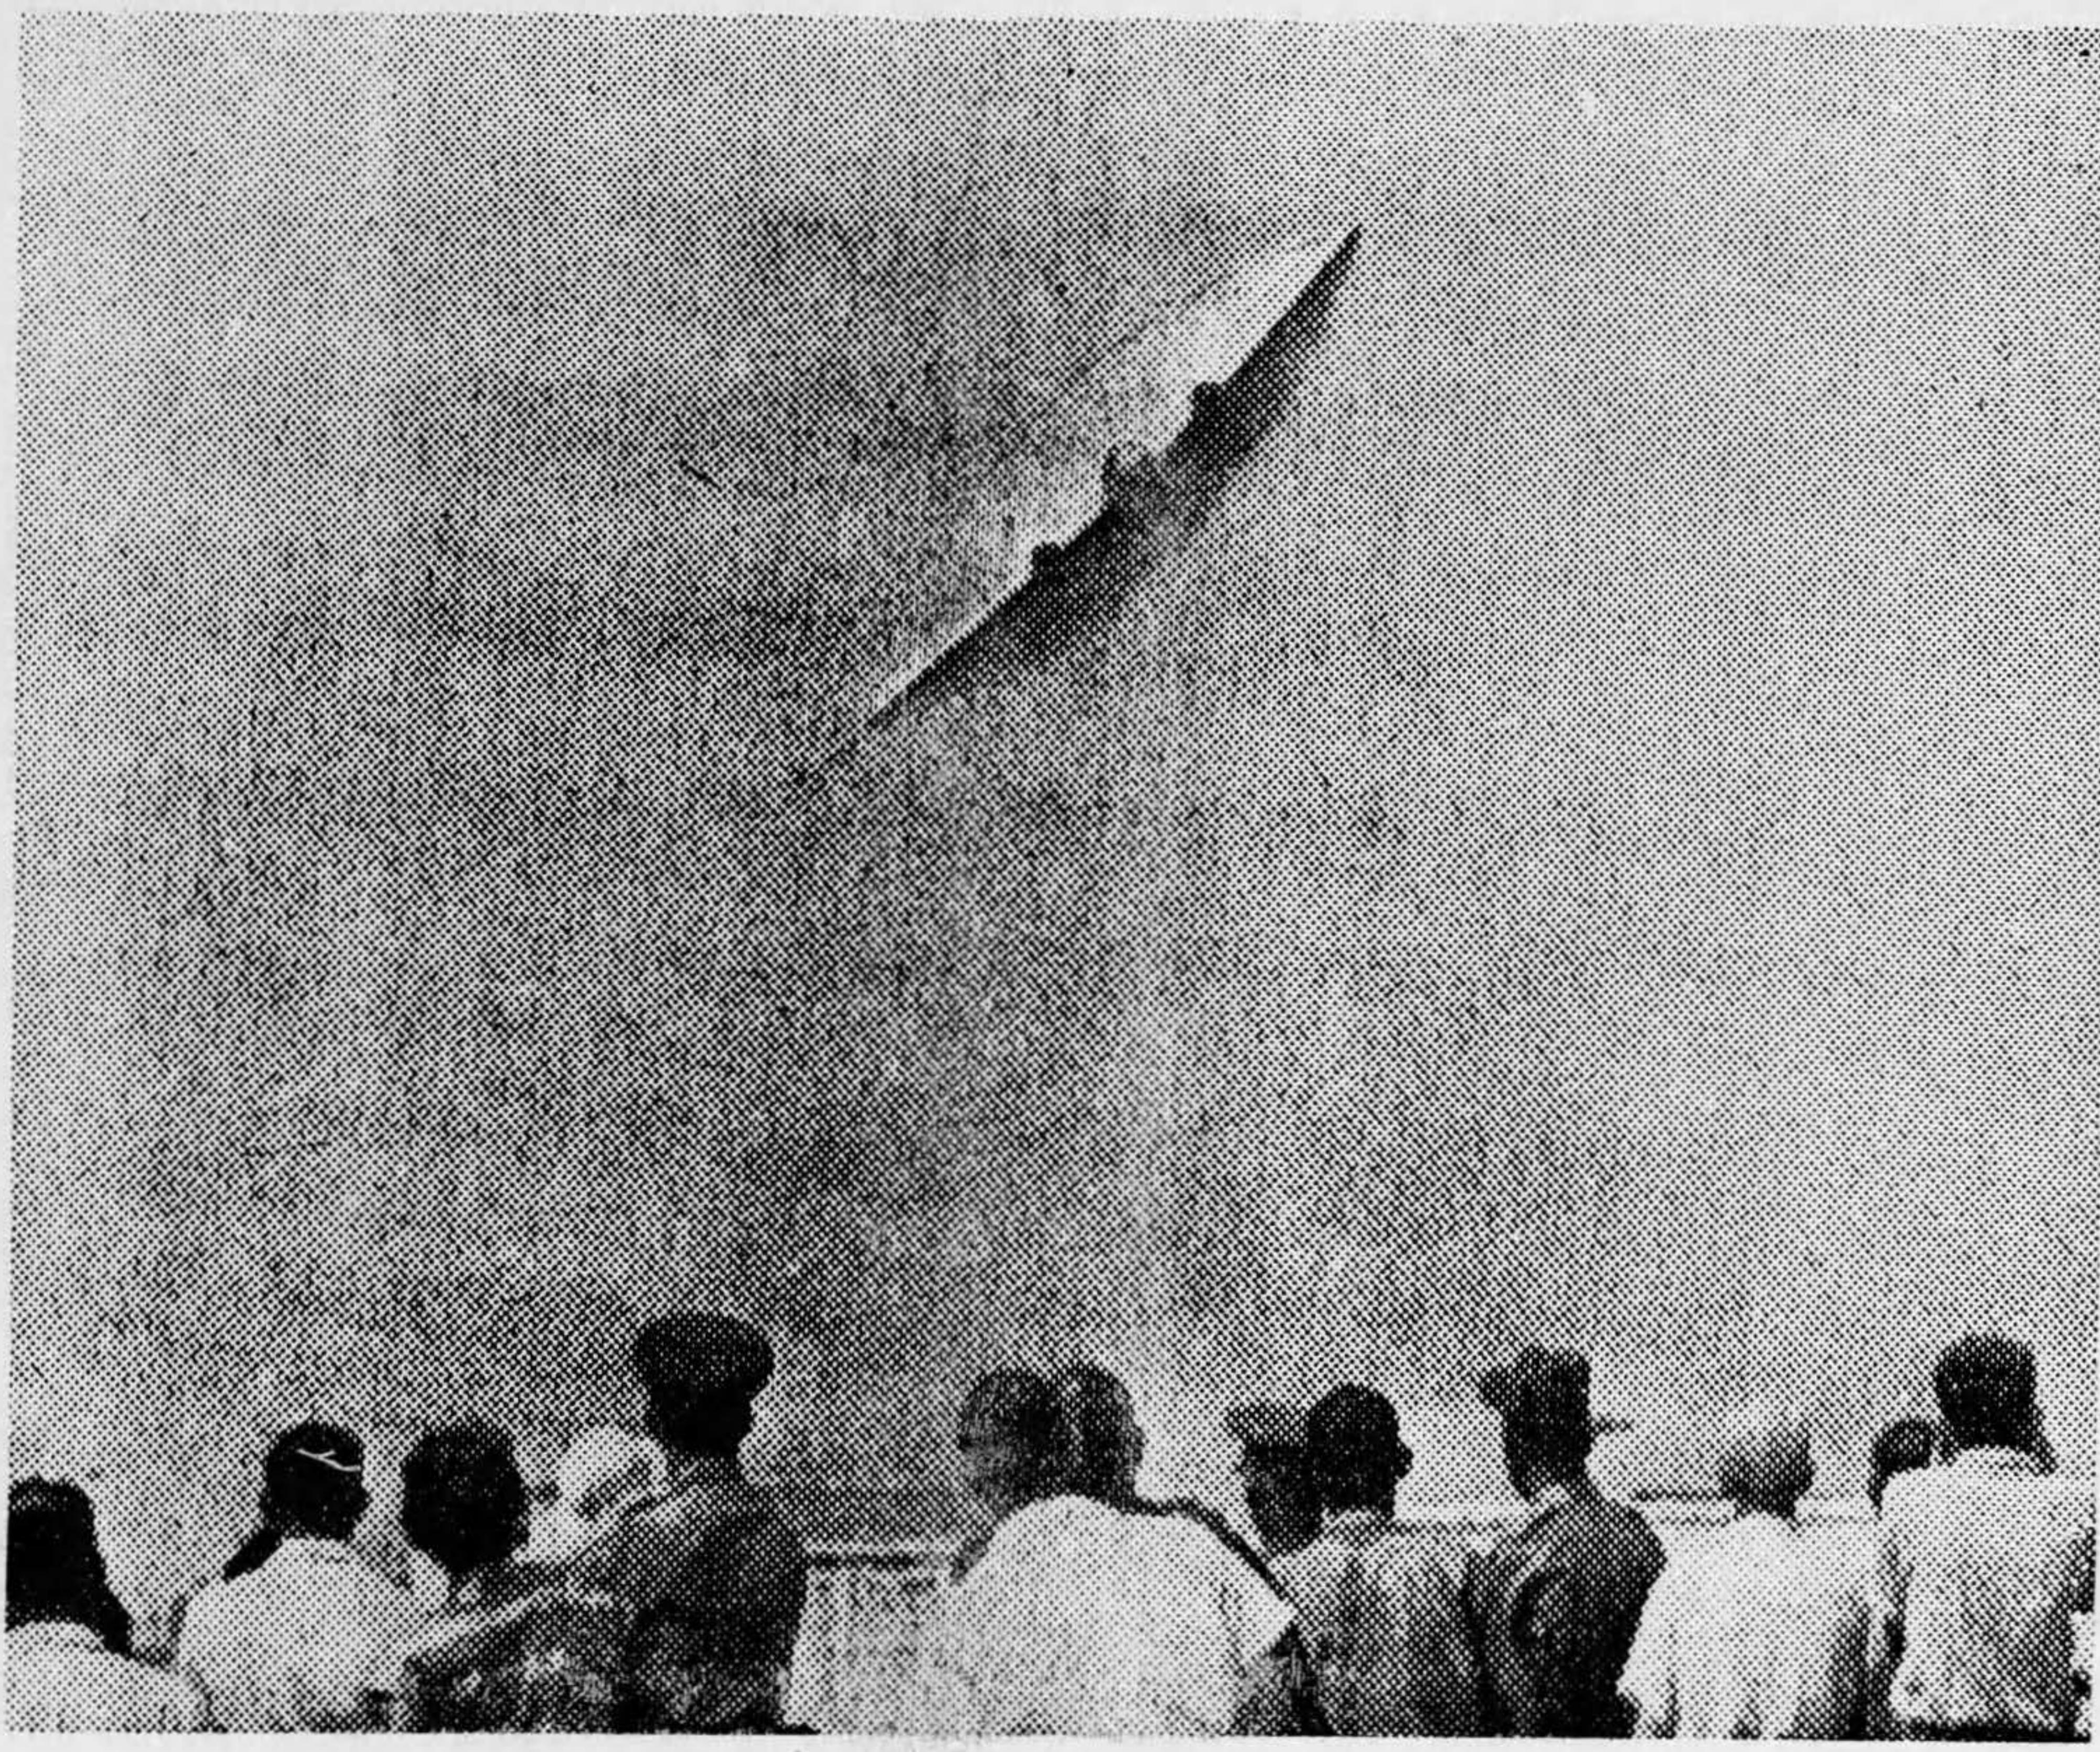

A low-flying jet, enveloped in an aura of cloud made by the jet itself, can look like a strange object. This condensation phenomenon, called contrail, occurs when areas of low pressure develop on the wing surface; the air cools by expansion in the slowly moving boundary layer in contact with the wing. The depth of the boundary layer and the drop in pressure both increase with increasing air speed, but each depends very closely on the aerodynamic qualities of the wing. An excellent photograph of one such disk produced by a Canberra jet was taken on February 4, 1956, along the coast of Africa near Accra on a morning when the condensation phenomenon occurred several times during air maneuvers. The weather was fine, the sky cloudless with a few patches of haze over the sea, and visibility was more than eight miles. During the display the air speed of the jets was usually too low or the air too dry for the aura to form. "But over the cliff edge where the sea-breeze was just beginning to break through in patches the air would be moist enough to condense about $1\frac{1}{2}$ gm. of water droplets in each cubic metre of air, quite sufficient to produce the observed effect. The effect is increased by higher speeds at the end of a dive (when the angle of incidence of the aerofoil is least) . . . but it is likely that the patchy onset of the sea-breeze was the most important contributing factor." [7]
