5. PHOTOS <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No	6. SOURCE Military (AF)		<input checked="" type="checkbox"/> Was Astronomical Venus <input type="checkbox"/> Probably Astronomical <input type="checkbox"/> Possibly Astronomical
7. LENGTH OF OBSERVATION twenty-three minutes	8. NUMBER OF OBJECTS one	9. COURSE faded over horizon	<input type="checkbox"/> Other _____ <input type="checkbox"/> Insufficient Data for Evaluation <input type="checkbox"/> Unknown
10. BRIEF SUMMARY OF SIGHTING One round light larger than known star, orange-white changed to orange with red light. Seen at an azimuth of 330 dgrs & an elevation of "4000" feet (evidently low off horizon). Seen through binoculars and was also seen by two aircraft.		11. COMMENTS Concur with the opinion of the reporting officer that this sighting was generated by the planet Venus. The same object which had been reported in this same area on the previous night.	

Analysts' Comments:

Subject: UFO Sighting Reported by Griffis AFB, 10 April 1956

1. A check with astro charts (emphasizes) and astro almanacs show the planet Venus almost on the horizon (as observed from the ground) at 0320 Zone Time (1020 Local Time), and located at approximately 325 degrees (NW by N) azimuth. In vicinity of constellation Taurus.
as observed from that locality.

2. This coincides very well with information given by all principals involved. The reported size (size of a pea) also supports conclusions that it was Venus.

3. Venus prominent and very bright during this time of the year, and as stated in report, brighter than surrounding stars.

4. Note: object was observed for almost one-half hour with apparent little or no movement.

5. Observing stars or planets through binoculars has often been a source of inconsistent data in that it gives the object an illusion of movement, high speed and odd maneuvers, a fact not often known to many. (An attempt to keep a star fixed in the center of a binoculars' field of view will demonstrate this.)

6. Certain atmospheric conditions can make an astronomical body seem much larger, brighter and nearer when near the horizon. Example: Under such conditions the moon often appears 5 times larger than when viewed overhead. This effect is emphasized when observed in the air and against a dark sky, and have resulted in some weird effects being reported by pilots having their gaze fixed on the object while flying. A few UFO reports disclose that pilots have reported that the object is moving away or towards their aircraft.

7. This has often been found to be confusing, even to old, experienced pilots, and the explanation is generally unacceptable to them. Any phenomena encountered for the first time and without advance notice, such as Aurora borealis, sundogs, fireballs, meteoric showers, lighted balloons in jet streams, as shown from our files, can be very confusing.

8. Conclusions: Misinterpretation of a known object, Venus, by virtue of fact observed under conditions producing unconventional appearance.

All indications from data and computer is obj was Venus. (Almost 1/2 lit.)

- ① Venus very shiny and prominent at the time
- ② Venus low on horizon at NW by N at the precise time of sighting. (When Castellan observed)
- ③ Atmospheric refraction and other conditions caused it a seemingly lower appearance. (Similar to moon when observed near horizon and when obscured. Appears 4 times longer in prior case - particularly if conditions right. Arguing a black dog and high altitude. This could be emphasized.)
- ④ How many people know what happens when trying to see star or planet. These happenings that are not understood. (obj)
