Washington, D. C.

Gentlemen:

On the night of August 12, 1962 about 9:30 p.m. E.B.S.T., my family and I were looking at the moon with a small telescope using a 50 power eyepiece. I noticed a small bright object near the moon, I would say 200 to 300 miles above the surface north of east somewhere near the areas of Cavalerius and Herilius craters. It moved in a northerly direction moving closer in to the surface, disappearing at approximately 9:37 p.m. E.D.S.T. somewhere near Herodotus. Five of us saw it over this time. We know it was not a star as the moon would have eclipsed it. Also it was following in the same direction as the moon.

I would like to know if you could tell me anything about what we saw and who we could inform if we should ever see something like this again. There was about a seven-minute time lapse which I feel would have helped an observatory to see it.

Any information you can give me would be appreciated.

Sincerely yours,

Danbury, Connecticut

Mr. [REDACTED]  
[REDACTED]  
Danbury, Connecticut

Dear Mr. [REDACTED]:

We are unable to confirm the sightings you report in your letter of August 14, 1962.

It is our pleasure to enclose a recent copy of the Satellite Situation Report which will hopefully aid you in the pursuit of further celestial study.

Sightings of the nature that you describe are indeed common and it is recommended that you continue your observations in a manner closely attendant to the data contained in the enclosure.

Thank you for your interest in NASA, Goddard Space Flight Center and the space sciences.

Sincerely,

James S. Lacy, Jr.  
Office of Public Information
