7) General remarks

The object was first noted at 7:35 P.M. but this does not mean it had just arrived; it left at 7:55, direction S.E. with reference to the observer.

The object was rather dazzling and "flaring" to the naked eye.

The object had the form of a double hub cap, as shown in the drawing. For about 10 minutes the object did not move, so that it was possible to keep it in the telescope eye piece without any movement of the Theodolite. Nevertheless the object would continuously keep moving around its own axis. On the upper part of the object, some kind of an antenna was noticed; this antenna appeared to have approximately 3 feet in diameter and 8 to 10 feet high.

The color of the object was mainly silvery gray.

On the only side of the object which could be observed a certain number of dark spots were noticed, in a circular line as shown in the drawing; they gave the impression of being some kind of rivets but could as well have been openings or exhaust ports.

All around the object, with a width of approximately 10 feet, a vaporous jacket was noticed the color of which would cover the entire solar spectrum. While the object was stationary in the sky this gaseous emission was on the under surface giving the impression of buoying up the object.

The object gathered speed with such acceleration that it vanished within 5 seconds at the most from the moment it started moving. No noise whatsoever was noticed.

N O T E .- Data under paragraphs 2, 3, 4, 5 are entirely accurate and certified to by the signers. Data under paragraphs 6 and 7 are estimates.

UFO Sighting, Port-au-Prince, Haiti

18 October 1962

OSD, ISA (Capt Neill)
Wash 25 DC

1. The following information regarding an unidentified flying object sighting which occurred in the area of Port-au-Prince, Haiti on 30 August 1962 is forwarded in response to a telephone request by Major Hart, SAFOI. A copy of the report of the sighting is attached for your information.

2. It is the opinion of FTD that the object viewed by the witness in this sighting was the planet Venus. At the time reported for the beginning of the UFO sighting, Venus had a right ascension of 13 hours 22 minutes 24 seconds and a declination of -10 degrees 24 minutes 05 seconds. This location of the planet would have caused its position, as viewed from Port-au-Prince, to coincide closely with that reported for the UFO.

3. The witness reported that it was not necessary to move the telescope for approximately 10 minutes while observing the object. The apparent angular rate of motion of the planet is approximately 3.5 degrees in 10 minutes and as it nears the horizon atmospheric refraction probably reduces this rate slightly. As best as can be determined from the report, the optical equipment used by the witness has a field of view of approximately 2 degrees. Observation of the object for approximately 10 minutes without moving the scope is quite possible.

4. Information regarding the vertical temperature gradient at Port-au-Prince at the time of the sighting is not available; however, the general description of the weather, as provided in the report, indicates the probability of a temperature inversion. At the lower elevations the effects of inversions tend to increase the distortion of astronomical objects by the atmosphere. These objects are flattened and dispersion effects cause them to appear multi-colored. Often objects viewed under these conditions appear to jump around and/or to move radially. Further, these conditions often cause them to appear to ascend rapidly just at the moment of setting. In this sighting bad seeing was probably a contributing factor. In these cases atmospheric tremors are magnified as well as the images.

OFFICIAL FILE COPY

OFFICIAL FILE COPY

5. At the time of the sighting the bright star Alpha Virgo (Spica), magnitude 1.2, was only approximately one half degree (the angular diameter of the moon) from Venus. Though the optical equipment used by the witness could resolve these two objects, it is possible that due to atmospheric conditions Spica was a contributing factor. Spica was just to the left and above Venus at the time of the sighting.

6. Venus at the time of the sighting had a magnitude of -3.9 and was by far the brightest object in the sky, the moon having set 41 minutes earlier at 1854. As viewed from the earth .511 of the planet's surface was illuminated, presenting an effect similar to the moon just before the last quarter. Coupled with atmospheric effects this apparent distortion could have been a contributing factor.

7. It is concluded that the misidentification of the planet Venus was the cause for the UFO sighting which occurred at Port-au-Prince, Haiti on 30 August 1962. Atmospheric effects which distorted the planet, the apparent nearness of the star Spica to the planet and unfamiliarity of the witness with astronomical objects were probably contributing factors.

8. This UFO sighting does not contain any evidence of threat to the security of the United States.

UNITED STATES AIR FORCE MISSION TO HAITI (CAIRC)

C/O AMERICAN EMBASSY
PORT-AU-PRINCE, HAITI

REPLY TO:
ATTN OF:

C

10 September 1962

SUBJECT:

Unidentified Flying Object in the Area of Port-au-Prince, Haiti

TO: Headquarters USAF (AFCIM)

1. In accordance with paragraph 15, AFM 200-2, 14 September 1969, the following eye witness data is submitted on an object sighted in the sky south-west of Port-au-Prince, Haiti:

a. Description of Object:

(1) Formed like two automobile hubcaps placed together (see position 2 of attached drawings).

(2) By use of a theodolite the observer estimated the diameter of the object to be about 70 feet and the thickness about 10 feet.

(3) The color was predominately a silver grey.

(4) One object.

(5) Not applicable.

(6) Around the perimeter of the object there appeared to be regularly spaced openings which were believed to be exhaust ports. From one of the surfaces (top or bottom) an antenna-like object about three feet in diameter and eight to ten feet long could be seen.

(7) There was a cloud of gaseous material, apparently emanating from the exhaust ports, with a width of around ten feet enveloping the object. This gaseous jacket was many-colored.

(8) No sound was evident at any time.

(9) None.

b. Description of Course of Object:

(1) The observers who reported this instance were having supper at an out-door restaurant when they noticed this flight object in the sky.

(2) The angle of elevation was 24 degrees 4 minutes and the magnetic azimuth 261 degrees 30 minutes.

(3) The same object remained stationary.

(4) While the object remained in one location in the sky it did keep rotating in position. (see four positions on attached drawing).

(5) The object disappeared rapidly, in about five seconds in a direction straight away from the observers or approximately 250 degrees and 30 minutes.

(6) The object was observed for twenty minutes.

c. Manner of Observation:

(1) Observation was ground visual.

(2) Use was made of a Tachymeter Theodolite WILD T-16 manufactured by WILD HEERBRUGG, SWITZERLAND.

(a) Diameter of objective: 10 mm (1.52")

(b) Magnifying power 23 X

(c) Shortest focusing distance 1,40 m (4 $\frac{1}{2}$ ')

(d) Horizontal circle divided into single degrees, all of which are numbered 79 mm (3,1')

(e) Vertical circle: same arrangement

(f) Circle reading with scale microscope 60'

or 100c

(g) Estimation to 1/10th of a minute

Circle clamp fastening horizontal circle to alidade.

(h) 1 circular level

(i) 1 plate level, centrally arranged between the standards, sensitivity 30" per 2 mm

(j) 1 vertical circle level for coincidence setting, sensitivity 20" per 2 mm.

(k) Circular compass set into a special holder which latter is screwed to the standard. A horizontal eye piece which can be adapted to the observer's visual acuity gives a clear picture of the compass disc with degree division, which can be read to 1/10th of a degree with an index line.

(3) Not applicable.

d. Time and Date of sighting:

(1) Between 301.35° and 301.55°.

(2) Night.

e. Location of observer:

(1) 72 degrees, 22 minutes, 20 seconds West longitude and 18 degrees, 21 minutes, 10 seconds North latitude.

f. Identifying Information on Observer:

(1) Mr. [REDACTED] [REDACTED], 12 years of age, Merchant Engineering Co., Port-au-Prince, Haiti, [REDACTED] of Mission Merchant Engineering Co., Consulting Engineer of the International Bank for Reconstruction & Development. I have known Mr. [REDACTED] for a year and a half and consider him to be a stable, mature and well educated individual. I am forwarding this report to you only because I feel that he is a reliable source for this information.

Mr. [REDACTED] - unknown to me.

Mrs. [REDACTED] - unknown to me.

g. Weather and Winds Affect Conditions:

(1) The night was dark and clear, there was no moon, with visibility ten miles or better.

(2) None available.

(3) Ceiling - unlimited.

(4) Visibility - at least ten miles.

(5) There was no cloud cover that night.

(6) No thunderstorms.

(7) Temperature unknown.

h. None.

i. None.

j. None.

1. Colonel Richard Curtis, Chief USAT Mission to Haiti, Port-au-Prince, Haiti, knows the principal observer, Mr. [REDACTED] as I do. I can only feel sure that he has described this object as accurately as possible. The fact that he had the advantage of an optical instrument to observe details of the object lends credence to his report.

2. None.

3. Prior to the completion of this report I learned that an object had been sighted by a Marine helicopter pilot, Capt. James Gordon. On the evening of 7 September 1962 he observed a lighted object in the sky in a south-westerly direction from his home in Petionville on the eastern suburb of Port-au-Prince. He first observed it at approximately 0723L stationery in the sky. He used regular 7 x 50 binoculars for his observation. At 0723L the object moved higher in the sky and to the west. At 0725L it moved straight down in the sky until it passed from sight behind a ridge of mountains.

Captain Gordon was unable to see many details on the object but described it to be similar in shape to the object seen by Mr. [REDACTED]. He could not distinguish any antenna but confirmed the gas on the lower side of the object. Observations conditions were excellent as it was a clear night with a half moon and no clouds.

4. We are establishing watches each night and I will report further observations to you if they occur.

[REDACTED] ENGINEERING CO.

Port-au-Prince, September 5, 1962

To : U.S.I.T. Mission to Haiti
Port-au-Prince, Haiti

Subject : Sighting of an Unidentified Flying Object in the
Vicinity of Port-au-Prince.

On the evening of August 30, 1962 at 7:34 P.M. while sitting
out-of doors with two friends, Mr. [REDACTED] and Mr. [REDACTED]
[REDACTED], I observed a lit object in the sky. I have stated circum-
stances on the following report which I am forwarding to you for any use
you care to make of it.

1) Persons who made the observations and the measurements:

- Mr. [REDACTED] of Mission Technical Engineering Co.,
Consulting Engineer of the International Bank for Reconstruction
& Development
- Mr. [REDACTED], engineer.

2) Date and time of observations:

August 30, 1962, between 7:35 and 7:50 P.M. Haitian time corresponding
to the U.S.T.

3) Instrument used for observations: Tachymeter "Theodolite TILDE T-16 made
by "TILDE WERKSTADEN, SWITZERLAND". The main technical features to the
instruments are the following:

- Diameter of objective: 50 mm (1.53")
- Magnifying power 23 X
- Shortest focusing distance 1,40 m (4.6')
- Horizontal circle divided into single degrees,
all of which are numbered 79 mm (3,1')
- Vertical circle: same arrangement
- Circle reading with scale micrometer 60'
- on 100c
- Estimation to 1/1000 of a minute
- Circle clamp fastening horizontal circle to slide.

C
D
P
Y

- 2 -

- 1 circular level
 - 1 plate level, centrally provided between the standards, sensitivity, 30" per 2 mm
 - 1 vertical circle level for coincidence setting, sensitivity 30" per 2 mm.
 - Circular compass set into a special holder which latter is screwed to the standard. A horizontal eye piece which can be adapted to the observer's visual acuity gives a clear picture of the compass disc with degree division, which can be read to 1/10th of a degree with an index line.
- b) Site of observation: following are the geographic coordinates of the place where the instrument was set:
- Longitude: $72^{\circ} 22' 20''$
Latitude : N $18^{\circ} 31' 18''$
True azimuth: $249^{\circ} 02'$
Magnetic azimuth: $251^{\circ} 30'$
- 5) Heading of the instrument:
- Magnetic heading: S $71^{\circ} 30' W$
Angle of inclination: $24^{\circ} 45'$ from sea level
- 6) Data concerning the object (this data is obviously approximated because of impossibility of setting up the instrument in a different place. Error of calculation is to be considered within $\pm 20'$):
- Altitude from sea level: 7000 feet
 - Distance from observer : 13000 feet
 - Diameter of object : 70 feet
 - Estimated geographic coordinates of object:
Longitude: $72^{\circ} 24'$
Latitude : N $18^{\circ} 38'$
